# Greek Language Support for XHATEX and LualATEX

Apostolos Syropoulos Xanthi, Greece asyropoulos@yahoo.com

2009/11/23Last Updated 2017/02/10

#### Abstract

The xgreek package provides rudimentary support for Greek language type-setting with XHMEX and LualMEX. In particular, it provides support for modern Greek (either monotonic or polytonic) and ancient Greek.

# 1 Introduction

The xgreek package provides rudimentary support for Greek language typesetting with XHMEXand LualATEX. Users will be able to typeset documents in either modern Greek (monotonic or polytonic) or ancient Greek by selecting the appropriate package option. The default "language" is monotonic Greek.

Support for LuaLATEX was provided by Javier Bezos.

## 2 The Source Code

According to the Unicode standard

http://www.unicode.org/Public/UNIDATA/UnicodeData.txt

the uppercase form of GREEK SMALL LETTER EPSILON WITH TONOS IS GREEK CAPITAL LETTER ETA WITH TONOS. This is certainly wrong. The main reason is that accents are not part of the letter as for example is the case with LATIN SMALL LETTER K WITH CARON. Since, XHMTEX blindly follows the Unicode standard, commands like \MakeUppercase produce wrong output. For this reason I first need to set up the correct \uccodes and \lcodes.

```

I redefine \today so as to produce dates in Greek. The names of months are defined by the macro \gr@month.

```
374 \def\gr@month{%
375 \ifcase\month\or Ιανουαρίου\or Φεβρουαρίου\or Μαρτίου\or Απριλίου\or
376 Μαΐου\or Ιουνίου\or Ιουλίου\or Αυγούστου\or
377 Σεπτεμβρίου\or Οκτωβρίου\or Νοεμβρίου\or Δεκεμβρίου\fi}
378 \def\today{\number\day \space \gr@month\space \number\year}
```

When either polytonic Greek or ancient Greek is the main language of the document, then the macro \gr@c@month becomes active.

```
379 \def\gr@c@month{%
380 \ifcase\month\or Ίανουαρίου\or Φεβρουαρίου\or Μαρτίου\or Άπριλίου\or
381 Μαΐου\or Ίουνίου\or Ιουλίου\or Αὐγούστου\or Σεπτεμβρίου\or
382 ℧κτωβρίου\or Νοεμβρίου\or Δεκεμβρίου\fi}
```

Next, I define a few macros that allow one to access characters that are not usually easily accessible from the keyboard (e.g., the sampi or the koppa symbol). The list includes a command for the unicode symbol GREEK ANO TELEIA, which, in some systems, is confused with MIDDLE DOT. The use of command \numer@lsign will be explained later.

```
383 \def\anwtonos{'} %GREEK NUMERAL SIGN
384 \let\numer@lsign\anwtonos
385 \def\katwtonos{,} %GREEK LOWER NUMERAL SIGN
```

```
386 \def\koppa{\char"03DF\relax}
387 \def\sampi{\char"03E1\relax}
388 \def\Digamma{\char"03DC\relax}
389 \def\ddigamma{\char"03DD\relax}
390 \def\anoteleia{\char"0387\relax}
391 \def\euro{\char"20AC\relax}
392 \def\permill{\char"2030\relax}
```

Many users prefer the use of the letters sigma and tau instead of the stigma symbol in Greek numerals, therefore, by default the  $\stigma$  command expands to " $\sigma\tau$ ". 393  $\def\stigma\{\sigma\tau\}$ 

The following commands take care of the basic rules of typography. Note that the first command changes the way space is added after punctuation symbols and the last two commands force LATEX to add indentation space to the first paragraph after a header. Since a number of users need, for their own reasons, to be able to disable this particular feature I have introduced a new package option, namely noindentfirst, which restores the default behavior. In order to be able to do this I need the original value of the boolean variable \@afterindentfalse.

```
394 \frenchspacing
395 \let\@saveafterindentfalse\@afterindentfalse
396 \let\@afterindentfalse\@afterindenttrue
397 \@afterindenttrue
```

LualateX and XalateX have different ways to load hyphenation patterns. Package luahyphenrules by Javier Bezos facilitates this process for people who want to use LualateX and the "traditional" way to load hyphenation patterns. To ensure proper inclusion of LuaTeX staff, I use the following "idiom":

\ifx\directlua\undefined non LuaEEX code\else LuaEEX code\fi

398 \ifx\directlua\undefined\else\RequirePackage{luahyphenrules}\fi

The code that follows specifies which hyphenation patterns will be active. The XHMTEX code is quite standard and depends on the babel pattern loading mechanism, while the LualMTEX code uses the \HyphenRules macro, which has essentially the functionality of the \selectlanguage macro.

```
399 \DeclareOption{monogreek}{%
      \ifx\directlua\undefined%
      \language\l@monogreek\else\HyphenRules{monogreek}\fi%
401
402 }
403 \verb|\DeclareOption{polygreek}{ } { \% }
      \ifx\directlua\undefined%
404
      \language\l@polygreek\else\HyphenRules{polygreek}\fi%
405
      \polytonicn@mes%
406
      \let\gr@month\gr@c@month%
407
408 }
409 \DeclareOption{ancientgreek}{%
      \ifx\directlua\undefined%
410
411
      \language\l@ancientgreek\else\HyphenRules{ancientgreek}\fi%
412
      \@ncientn@mes%
```

```
413 \let\gr@month\gr@c@month%
414 }
```

If a user wants to use the stigma symbol in Greek numerals, she should use the stigma option.

```
415 \DeclareOption{stigma}{%
416 \def\stigma{\char"03DB\relax}
417}
```

As noted above, the new option noindentfirst restores the default LATEX behavior of adding no indentation to the first paragraph after any header.

Nowadays it is customary in Greece to use Greek numerals without the GREEK NUMERAL SIGN at the end of numeral. Thus, the nonumeralsign option disables the typesetting of the GREEK NUMERAL SIGN at the end of Greek numerals.

```
421 \DeclareOption{nonumeralsign}{%
422 \let\numer@lsign\relax
423 }
```

By default the monogreek option is activated.

```
424 \verb|\ExecuteOptions{monogreek}|
```

425 \ProcessOptions

Now I am going to define the macros that typeset alphabetic Greek numerals. The code is borrowed from the greek option for the babel package.

\gr@ill@value

When the argument of  $\greeknumeral$  has a value outside of the acceptable bounds (0 < x < 999999) a warning will be issued (and nothing will be printed). 426  $\def\greellevalue#1$ {%

```
427 \PackageWarning{xgreek}{Illegal value (#1) for greeknumeral}}
```

\anw@true \anw@false \anw@print When a large number with three *trailing* zeros is to be printed those zeros *and* the numeric mark need to be discarded. As each 'digit' is processed by a separate macro *and* because the processing needs to be expandable we need some helper macros that help remember to *not* print the numeric mark (\numer@lsign).

The command \anw@false switches the printing of the numeric mark off by making \anw@print expand to nothing. The command \anw@true (re)enables the printing of the numeric marc. These macro's need to be robust in order to prevent improper expansion during writing to files or during \uppercase.

```
428 \DeclareRobustCommand\anw@false{%
429 \DeclareRobustCommand\anw@print{}}
430 \DeclareRobustCommand\anw@true{%
431 \DeclareRobustCommand\anw@print{\numer@lsign}}
432 \anw@true
```

\@greeknumeral

This command is used to typeset Greek numerals. The command uses \numer@lsign to typeset the NUMERAL SIGN. Obviously, when the user has specified the nonumeralsign option, then numeral comes out without the trailing NUMERAL SIGN. However, when a user wants to typeset a Greek numeral, the numeral must come out correctly, regardless of what appears in headers, etc. And that is exactly the reason why this command is inaccessible to users. The command \@greeknumeral needs to be fully expandable in order to get the right information in auxiliary files. Therefore we use a big \if-construction to check the value of the argument and start the parsing at the right level.

## $433 \ensuremath{\mbox{def}\mbox{\mbox{\mbox{$0$}}} eeknumeral#1{\%}$

If the value is negative or zero nothing is printed and a warning is issued.

```
434 \ifnum#1<\@ne\space\gr@ill@value{#1}%
435 \else
436 \ifnum#1<10\expandafter\gr@num@i\number#1%
437 \else
438 \ifnum#1<100\expandafter\gr@num@ii\number#1%
439 \else
```

The available shorthands for  $1.000 \ (\mbox{Qm})$  and  $10.000 \ (\mbox{QM})$  are used to save a few tokens.

```
440 \ifnum#1<\@m\expandafter\gr@num@iii\number#1%
441 \else
442 \ifnum#1<\@M\expandafter\gr@num@iv\number#1%
443 \else
444 \ifnum#1<100000\expandafter\gr@num@v\number#1%
445 \else
446 \ifnum#1<1000000\expandafter\gr@num@vi\number#1%
447 \else
```

If the value is too large, nothing is printed and a warning is issued.

```
\space\gr@ill@value{#1}%
448
                     \fi
449
450
                  \fi
451
                \fi
             \fi
452
453
           \fi
        \fi
454
      \fi
455
456 }
```

What is left to make complete the definition of command \greeknumeral is a set of macros to produce the various digits.

\gr@num@i \gr@num@ii \gr@num@iii As there is no "digit" representing 0 in this system, the zeros are simply discarded. When there is a large number with three *trailing* zeros also the numeric mark is discarded. Therefore these macros need to pass the information to each other about the (non-)translation of a zero.

```
\ifnum#1=\z0\else\anw@true\fi\anw@print}
                                               459
                                               460 \def\gr@num@ii#1{%
                                                             461
                                                             \ifnum#1=\z@\else\anw@true\fi\gr@num@i}
                                               462
                                               463 \def\gr@num@iii#1{%
                                                             \ifcase#1\or \rho\or \sigma\or \tau\or \phi\or \psi\or \omega\or \sampi\fi
                                                             \ifnum#1=\z@\anw@false\else\anw@true\fi\gr@num@ii}
             \gr@num@iv
                                               The first three "digits" always have the numeric mark, except when one is dis-
               \gr@num@v
                                                carded because it's value is zero.

\@Greeknumeral
                                                The command \@Greeknumeral prints uppercase Greek numerals. The parsing is
                                                depends on the value of \numer@lsign.
                                               478 \ensuremath{\mbox{def}\ensuremath{\mbox{\mbox{\mbox{$0$}}}}\xspace 178 \ensuremath{\mbox{\mbox{$0$}}}\xspace 178 \ensuremath{\mbox{\mbox{$0$}}}\xspace 178 \ensuremath{\mbox{$0$}}\xspace 178 \ensuremath{\mbox{$0$}}\xspace
```

performed by the macro \@greeknumeral. The printing of the NUMERAL SIGN

\expandafter\MakeUppercase\expandafter{\@greeknumeral{#1}}}

### \greeknumeral

This command prints lowercase Greek numerals and the NUMERAL SIGN is always printed.

## 480 \def\greeknumeral#1{%

- \let\@numer@lsign\numer@lsign%
- 482 \let\numer@lsign\anwtonos%
- \@greeknumeral{#1} 483
- \let\numer@lsign\@numer@lsign}

## \Greeknumeral

This command prints uppercase Greek numerals and the NUMERAL SIGN is always printed.

#### 485 \def\Greeknumeral#1{%

- \let\@numer@lsign\numer@lsign% 486
- \let\numer@lsign\anwtonos% 487
- \@Greeknumeral{#1} 488
- \let\numer@lsign\@numer@lsign} 489

The alphabetic numbering system is not the only numbering system employed by Greeks. In fact, Greeks used various systems that are now known as acrophonic numbering systems. Many scholars are familiar with the acrophonic Attic numbering system and the the command **\atticnum** can be used to generate acrophonic Attic numerals. The acrophonic Attic numbering system, like the Roman one, employs letters to denote important numbers. Multiple occurrence of a letter denote a multiple of the "important" number, e.g., the letter I denotes 1, so III denotes 3. Here are the basic digits used in the acrophonic Attic numbering system:

- I denotes the number one (1)
- $\Pi$  denotes the number five (5)
- $\Delta$  denotes the number ten (10)
- H denotes the number one hundred (100)
- X denotes the number one thousand (1000)
- M denotes the number ten thousands (10000)

Moreover, the letters  $\Delta$ , H, X, and M under the letter  $\Gamma$  (a form of  $\Pi$ ) denote five times their original value. In particular, the symbol  $\mathbb{F}$ , denotes the number 50, the symbol  $\mathbb{F}$  denotes the number 5000, and the symbol  $\mathbb{F}$  denotes the number 50,000. It must be noted that the numbering system does not provide negative numerals or a symbol for zero.

\@@atticnum

Now, let me definite the macro \@@atticnum. This macro uses one integer variable (or counter in TFX's jargon.)

```
490 \newcount\@attic@num
```

The macro \@@atticnum is also defined as a robust command.

```
491 \DeclareRobustCommand*{\@@atticnum}[1]{%
```

After assigning to variable \@attic@num the value of the macro's argument, we make sure that the argument is in the expected range, i.e., it is greater than zero, and less or equal to 249999. In case it isn't, it simply produces a \space, warns the user about it and quits. Although, the \atticnum macro is capable to produce an Athenian numeral for even greater intergers, the following argument by Claudio Beccari convised me to place this upper limit:

According to psychological perception studies (that ancient Athenians and Romans perfectly knew without needing to study Freud and Jung) living beings (which includes at least all vertebrates, not only humans) can perceive up to four randomly set objects of the same kind without the need of counting, the latter activity being a specific acquired ability of human kind; the biquinary numbering notation used by the Athenians and the Romans exploits this natural characteristic of human beings.

```
492 \@attic@num#1\relax
493 \ifnum\@attic@num<\@ne%
494 \space%
```

```
495 \PackageWarning{xgreek}{%
496 Illegal value (\the\@attic@num) for acrophonic Attic numeral}%
497 \else\ifnum\@attic@num>249999%
498 \space%
499 \PackageWarning{xgreek}{%
500 Value too large (\the\@attic@num) for acrophonic Attic numeral}%
501 \else
```

Having done all the necessary checks, it is possible to proceed with the actual computation. If the number is greater than 49999, then it certainly has at least one "digit". The macro finds all such digits by continuously subtracting 50000 from \QatticQnum, until \QatticQnum becomes less than 50000.

```
502 \@whilenum\@attic@num>49999\do{%
503 \______010147\advance\@attic@num-50000}%
```

Next the macro checks for tens of thousands.

```
504 \\Qwhilenum\\Qattic@num>9999\\do{\%}
505 \\M\advance\\Qattic@num-\\QM}\\%
```

Since a number can have only one F "digit" (equivalent to 5000), it is easy to check whether is should have one and produce the corresponding numeral when it does have one.

The macro should also check for thousands, the same way it checked for tens of thousands.

```
509 \@whilenum\@attic@num>999\do{%
510 X\advance\@attic@num-\@m}%
```

Since a numeral can have at most one F "digit" (equivalent to 500), this should be handled the way the macro handled the case of the five thousands "digit".

It is time to check hundreds, which follow the same pattern as thousands.

```
514 \@whilenum\@attic@num>99\do{%
515 H\advance\@attic@num-100}%
```

A numeral can have only one F "digit" (equivalent to 50).

The macro now checks now for tens digit.

```
\label{eq:continuing} $$ \end{center} $$ \end{center} $$ \end{center} $$ \end{center} $$ \end{center} $$ $$ \end{center} $$ \end{ce
```

Finally, it has to check for fives and the digits 1, 2, 3, and 4.

```
\@whilenum\@attic@num>4\do{%
```

\@atticnum

The command \@atticnum has one argument, which is a counter. It calls the command \@Qatticnum to process the value of the counter.

```
525 \def\@atticnum#1{%
526 \expandafter\@@atticnum\expandafter{\the#1}}
```

\atticnum

The command \atticnum is a wrapper that declares a new counter in a local scope, assigns to it the value of the argument of the command and calls the macro \@atticnum. This way the command can process correctly either a number or a counter.

```
527 \def\atticnum#1{%

528 \@attic@num#1\relax

529 \@atticnum{\@attic@num}}
```

\greek@alph \greek@Alph Here I redefine the macros \@alph and \@Alph. First, I define some placeholders 530 \let\latin@alph\@alph

531 \let\latin@Alph\@Alph

Then I define the Greek versions; the additional \expandafters are needed in order to make sure the table of contents will be correct (e.g., when there are appendices).

```
532 \end{forestable}  532 \end{forestable}  533 \end{forestable}  632 \end{forestable}
```

By default Greek alphabetic enumerals instaed of Latin numerals are used to enumerate items in an enumeration environment.

```
\let\@alph\greek@alph\let\@Alph\greek@Alph
```

If for some reason, one needs to have the Latin numerals back, then she has to invoke command \nogreekalph. And if she wants to switch back, then she has to use the \greekalph command:

```
536 \def\nogreekalph{%
537 \let\@alph\latin@alph
538 \let\@Alph\latin@Alph}
539 \def\greekalph{%
540 \let\@alph\greek@alph
541 \let\@Alph\greek@Alph}
```

\setlanguage

We provide the \setlanguage command which activates the hypehnation patterns of some other language. It is similar to babel's \selectlanguage, but we opted to use a new name to avoid possible name conflicts. Valid arguments include monogreek, polygreek, ancientgreek, and american. As was noted previously, package luahyphenrules provides the command \HyphenRules which has exactly the same functionality as this command. So when using LualaTeX users will actually use the \HyphenRules command.

```
542 \ifx\directlua\undefined%
    \def\setlanguage#1{%
543
       \expandafter\ifx\csname l@#1\endcsname\relax%
544
       545
       \typeout{ default hyphenation patterns are used.^^J}%
546
547
       \language=0%
548
       \else\language=\csname 10#1\endcsname\fi}
549 \ensuremath{\setminus} else
    \let\setlanguage\HyphenRules
550
551\fi
```

The macros \grtoday and \Grtoday produces the current date, only that the month and the day are shown as greek numerals instead of arabic as it is usually the case. In addition, the two commands differ in that the later produces the Greek numerals in uppercase.

```
552 \def\grtoday{%
553 \expandafter\greeknumeral\expandafter{\the\day}\space
554 \gr@c@month\space
555 \expandafter\greeknumeral\expandafter{\the\year}}
556 \def\Grtoday{%
557 \expandafter\Greeknumeral\expandafter{\the\day}\space
558 \gr@c@month\space
559 \expandafter\Greeknumeral\expandafter{\the\year}}
560 \(/xgreek)
```
