Part I

Getting started

1 History

This package began life as a LaTeX interface to select system-installed Mac OS X fonts in Jonathan Kew's XaTeX, the first widely-used Unicode extension to TeX. Over time, XaTeX was extended to support OpenType fonts and then was ported into a cross-platform program to run also on Windows and Linux.

More recently, LuaTeX is fast becoming the TeX engine of the day; it supports Unicode encodings and OpenType fonts and opens up the internals of TeX via the Lua programming language. Hans Hagen's ConTeXt Mk. IV is a re-write of his powerful typesetting system, taking full advantage of LuaTeX's features including font support; a kernel of his work in this area has been extracted to be useful for other TeX macro systems as well, and this has enabled fontspec to be adapted for LaTeX when run with the LuaTeX engine.

2 Introduction

The fontspec package allows users of either X₄T_EX or LuaT_EX to load OpenType fonts in a Late X document. No font installation is necessary, and font features can be selected and used as desired throughout the document.

Without fontspec, it is necessary to write cumbersome font definition files for LTEX, since LTEX's font selection scheme (known as the 'NFSS') has a lot going on behind the scenes to allow easy commands like \emph or \bfseries. With an uncountable number of fonts now available for use, however, it becomes less desirable to have to write these font definition (.fd) files for every font one wishes to use.

Because fontspec is designed to work in a variety of modes, this user documentation is split into separate sections that are designed to be relatively independent. Nonetheless, the basic functionality all behaves in the same way, so previous users of fontspec under X₄TeX should have little or no difficulty switching over to LuaTeX.

This manual can get rather in-depth, as there are a lot of details to cover. See the documents fontspec-example.tex for a complete minimal example to get started quickly.

2.1 Acknowledgements

This package could not have been possible without the early and continued support the author of X₃T₂X, Jonathan Kew. When I started this package, he steered me many times in the right direction.

I've had great feedback over the years on feature requests, documentation queries, bug reports, font suggestions, and so on from lots of people all around the world. Many thanks to you all.

Thanks to David Perry and Markus Böhning for numerous documentation improvements and David Perry again for contributing the text for one of the sections of this manual.

Special thanks to Khaled Hosny, who was the driving force behind the support for LuaET_EX, ultimately leading to version 2.0 of the package.

3 Package loading and options

For basic use, no package options are required:

\usepackage{fontspec}

Package options will be introduced below; some preliminary details are discussed first.

3.1 Font encodings

The 2016 release of fontspec initiated some changes for font encodings and the loading of xunicode. The 2017 release rolls out those changes as default.

The now-default tuenc package option switches the NFSS font encoding to TU. TU is a new Unicode font encoding, intended for both XaTeX and LuaTeX engines, and automatically contains support for symbols covered by LaTeX's traditional T1 and TS1 font encodings (for example, \%, \textbullet, \"u, and so on). As a result, with this package option, Ross Moore's xunicode package is **not** loaded. Some new, experimental, features are now provided to customise some encoding details; see Part V on page 55 for further details.

Pre-2017 behaviour can be achieved with the euenc package option. This selects the EU1 or EU2 encoding (X¬TEX/LuaTEX, resp.) and loads the xunicode package. Package authors and users who have referred explicitly to the encoding names EU1 or EU2 should update their code or documents. (See internal variable names described in Section 27 on page 69 for how to do this properly.)

3.2 Maths fonts adjustments

By default, fontspec adjusts LEX's default maths setup in order to maintain the correct Computer Modern symbols when the roman font changes. However, it will attempt to avoid doing this if another maths font package is loaded (such as mathpazo or the unicode-math package).

If you find that fontspec is incorrectly changing the maths font when it shouldn't be, apply the no-math package option to manually suppress its behaviour here.

3.3 Configuration

If you wish to customise any part of the fontspec interface, this should be done by creating your own fontspec.cfg file, which will be automatically loaded if it is found by X-TEX or LuaTEX. A fontspec.cfg file is distributed with fontspec with a small number of defaults set up within it.

To customise fontspec to your liking, use the standard .cfg file as a starting point or write your own from scratch, then either place it in the same folder as the main document for isolated cases, or in a location that X_TEX or LuaTEX searches by default; e.g. in MacTEX: ~/Library/texmf/tex/latex/.

The package option no-config will suppress the loading of the fontspec.cfg file under all circumstances.

3.4 Warnings

This package can give some warnings that can be harmless if you know what you're doing. Use the quiet package option to write these warnings to the transcript (.log) file instead.

Use the silent package option to completely suppress these warnings if you don't even want the .log file cluttered up.

4 Interaction with \LaTeX 2 ε and other packages

This section documents some areas of adjustment that fontspec makes to improve default behaviour with \LaTeX 2ε and third-party packages.

4.1 Verbatim

Many verbatim mechanisms assume the existence of a 'visible space' character that exists in the ASCII space slot of the typewriter font. This character is known in Unicode as U+2423: BOX OPEN, which looks like this: '\(\sigma'\).

When a Unicode typewriter font is used, LTEX no longer prints visible spaces for the verbatim* environment and \verb* command. This problem is fixed by using the correct Unicode glyph, and the following packages are patched to do the same: listings, fancyvrb, moreverb, and verbatim.

In the case that the typewriter font does not contain $' \square '$, the Latin Modern Mono font is used as a fallback.

4.2 Discretionary hyphenation: \-

\- ETEX defines the macro \- to insert discretionary hyphenation points. However, it is hard-coded in ETEX to use the hyphen - character. Since fontspec provides features to change the hyphenation character on a per font basis, the definition of \- is changed to adapt accordingly.

4.3 Commands for old-style and lining numbers

\oldstylenums \liningnums

Large for the end of the end of

4.4 Italic small caps

\itshape \slshape \scshape Note that this package redefines the \itshape, \slshape, and \scshape commands in order to allow them to select italic small caps in conjunction. With these changes, writing \itshape\scshape will lead to italic small caps, and \upshape subsequently

then moves back to small caps only. \upshape again returns from small caps to upright regular. (And similarly for for \slshape. In addition, once italic small caps are selected then \slshape will switch to slanted small caps, and vice versa.)

4.5 Emphasis and nested emphasis

\eminnershape

 $\text{ETEX } 2_{\mathcal{E}}$ allows you to specify the behaviour of \emph nested within \emph by setting the \eminnershape command. For example,

\renewcommand\eminnershape{\upshape\scshape}

will produce small caps within \emph{\emph{\...}}.

\emfontdeclare

The fontspec package takes this idea one step further to allow arbitrary font shape changes and arbitrary levels of nesting within emphasis. This is performed using the \emfontdeclare command, which takes a comma-separated list of font switches corresponding to increasing levels of emphasis. An example:

i. \emfontdeclare{\itshape, \upshape\scshape,\itshape} will lead to 'italics', 'small caps', then 'italic small caps' as the level of emphasis increases, as long as italic small caps are defined for the font. Note that \upshape is required because the font changes are cascading.

The implementation of this feature tries to be 'smart' and guess what level of emphasis to use in the case of manual font changing. This is reliable only if you use shape-changing commands in \emfontdeclare. For example:

```
\emfontdeclare{\itshape,\upshape\scshape,\itshape}
...
\scshape small caps \emph{hello}
```

Here, the emphasised text 'hello' will be printed in italic small caps since \emph can detect that the current font shape is already in the second 'mode' of emphasis.

\emreset

Finally, if you have so much nested emphasis that \emfontdeclare runs out of options, it will insert \emreset (by default just \upshape) and start again from the beginning.

4.6 Strong emphasis

\strong \strongenv

The \strong macro is used analogously to \emph but produces variations in weight. If you need it in environment form, use \begin{strongenv}...\end{strongenv}.

As with emphasis, this font-switching command is intended to move through a range of font weights. For example, if the fonts are set up correctly it allows usage such as \strong{...\strong{...}} in which each nested \strong macro increases the weight of the font.

\strongfontdeclare

Currently this feature set is somewhat experimental and there is no syntactic sugar to easily define a range of font weights using fontspec commands. Use, say, the following to define first bold and then black (k) font faces for \strong:

\strongfontdeclare{\bfseries,\fontseries{k}\selectfont}

\strongreset

If too many levels of \strong are reached, \strong reset is inserted. By default this is a no-op and the font will simply remain the same. Use \strong to start again from the beginning if desired.

An example for setting up a font family for use with \strong is discussed in 6.3.1 on page 18.

Part II

General font selection

This section concerns the variety of commands that can be used to select fonts.

These are the main font-selecting commands of this package. The \fontspec command selects a font for one-time use only; all others should be used to define the standard fonts used in a document, as shown in Example I. Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The Scale font feature will be discussed further in Section I4 on page 27, including methods for automatic scaling. Note that further options may need to be added to select appropriate bold/italic fonts, but this shows the main idea.

Note that while these commands all look and behave largely identically, the default setup for font loading automatically adds the Ligatures=TeX feature for the \setmainfont and \setsansfont commands. These defaults (and further customisations possible) are discussed in Section 8 on page 21.

The font features argument accepts comma separated $\langle font \, feature \rangle = \langle option \rangle$ lists; these are described later:

- For general font features, see Section 14 on page 27
- For OpenType fonts, see Part IV on page 34
- For X¬T¬EX-only general font features, see Part VII on page 61
- For LuaTeX-only general font features, see Part VI on page 59
- For features for AAT fonts in X₇T_FX, see Section 22 on page 62

Example 1: Loading the default, sans serif, and monospaced fonts.

```
\setmainfont{texgyrebonum-regular.otf}
\setsansfont{lmsans10-regular.otf}[Scale=MatchLowercase]
\setmonofont{Inconsolatazi4-Regular.otf}[Scale=MatchLowercase]
\rmfamily Pack my box with five dozen liquor jugs\par
\sffamily Pack my box with five dozen liquor jugs\par
\ttfamily Pack my box with five dozen liquor jugs
```

ick my box with five dozen liquor jugs

ck my box with five dozen liquor jugs

ack my box with five dozen liquor jugs

5 Font selection

In both LuaTEX and XETEX, fonts can be selected either by 'font name' or by 'file name', but there are some differences in how each engine finds and selects fonts — don't be too surprised if a font invocation in one engine needs correction to work in the other.

5.1 By font name

Fonts known to LuaTeX or XaTeX may be loaded by their standard names as you'd speak them out loud, such as *Times New Roman* or *Adobe Garamond*. 'Known to' in this case generally means 'exists in a standard fonts location' such as ~/Library/Fonts on Mac OS X, or C:\Windows\Fonts on Windows. In LuaTeX, fonts found in the TEXMF tree can also be loaded by name.

The simplest example might be something like

```
\setmainfont{Cambria}[ ... ]
```

in which the bold and italic fonts will be found automatically (if they exist) and are immediately accessible with the usual \textit and \textbf commands.

The 'font name' can be found in various ways, such as by looking in the name listed in a application like *Font Book* on Mac OS X. Alternatively, TEXLive contains the otfinfo command line program, which can query this information; for example:

```
otfinfo -a `kpsewhich lmroman1@-regular.otf`
```

results in 'LM Roman 10'.

LuaTeX users only In order to load fonts by their name rather than by their file-name (*e.g.*, 'Latin Modern Roman' instead of 'ec-lmrro'), you may need to run the script luaotfload-tool, which is distributed with the luaotfload package. Note that if you do not execute this script beforehand, the first time you attempt to typeset the process will pause for (up to) several minutes. (But only the first time.) Please see the luaotfload documentation for more information.

5.2 By file name

X₃T_EX and LuaT_EX also allow fonts to be loaded by file name instead of font name. When you have a very large collection of fonts, you will sometimes not wish to have them all installed in your system's font directories. In this case, it is more convenient to load them from a different location on your disk. This technique is also necessary in X₃T_EX when loading OpenType fonts that are present within your T_EX distribution, such as /usr/local/texlive/2\013/texmf-dist/fonts/opentype/public. Fonts in such locations are visible to X₃T_EX but cannot be loaded by font name, only file name; LuaT_EX does not have this restriction.

When selecting fonts by file name, any font that can be found in the default search paths may be used directly (including in the current directory) without having to explicitly define the location of the font file on disk.

Fonts selected by filename must include bold and italic variants explicitly.

```
\setmainfont{texgyrepagella-regular.otf}[
    BoldFont = texgyrepagella-bold.otf ,
    ItalicFont = texgyrepagella-italic.otf ,
    BoldItalicFont = texgyrepagella-bolditalic.otf ]
```

fontspec knows that the font is to be selected by file name by the presence of the '.otf' extension. An alternative is to specify the extension separately, as shown following:

```
\setmainfont{texgyrepagella-regular}[
    Extension = .otf ,
    BoldFont = texgyrepagella-bold ,
    ... ]
```

If desired, an abbreviation can be applied to the font names based on the mandatory 'font name' argument:

```
\setmainfont{texgyrepagella}[
    Extension = .otf ,
    UprightFont = *-regular ,
    BoldFont = *-bold ,
    ... ]
```

In this case 'texgyrepagella' is no longer the name of an actual font, but is used to construct the font names for each shape; the * is replaced by 'texgyrepagella'. Note in this case that UprightFont is required for constructing the font name of the normal font to use

To load a font that is not in one of the default search paths, its location in the filesystem must be specified with the Path feature:

Note that X_{\(\)}T_{\(\)}X and LuaT_{\(\)}X are able to load the font without giving an extension, but fontspec must know to search for the file; this can can be indicated by using the Path feature without an argument:

```
\setmainfont{texgyrepagella-regular}[
    Path, BoldFont = texgyrepagella-bold,
    ...]
```

My preference is to always be explicit and include the extension; this also allows fontspec to automatically identify that the font should be loaded by filename.

In previous versions of the package, the Path feature was also provided under the alias ExternalLocation, but this latter name is now deprecated and should not be used for new documents.

5.3 Querying whether a font 'exists'

```
\verb|\IfFontExistsTF| $$ \langle font\ name \rangle $$ {\langle true\ branch \rangle } {\langle false\ branch \rangle }$
```

The conditional \IfFontExistsTF is provided to test whether the $\langle font \ name \rangle$ exists or is loadable. If it is, the $\langle true \ branch \rangle$ code is executed; otherwise, the $\langle false \ branch \rangle$ code is.

This command can be slow since the engine may resort to scanning the filesystem for a missing font. Nonetheless, it has been a popular request for users who wish to define 'fallback fonts' for their documents for greater portability.

In this command, the syntax for the $\langle font \, name \rangle$ is a restricted/simplified version of the font loading syntax used for \fontspec and so on. Fonts to be loaded by filename are detected by the presence of an appropriate extension (.otf, etc.), and paths should be included inline. E.g.:

```
\IfFontExistsTF{cmr1\0}{T}{F}
\IfFontExistsTF{Times New Roman}{T}{F}
\IfFontExistsTF{texgyrepagella-regular.otf}{T}{F}
\IfFontExistsTF{Users/will/Library/Fonts/CODE2\0\0.TTF}{T}{F}
```

The \IfFontExistsTF command is a synonym for the programming interface function \fontspec_font_if_exist:nTF (Section 27 on page 69).

6 Commands to select font families

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling \fontspec for every use. While the \fontspec command does not define a new font instance after the first call, the feature options must still be parsed and processed.

\newfontfamily

For this reason, new commands can be created for loading a particular font family with the \newfontfamily command, demonstrated in Example 2. This macro should be used to create commands that would be used in the same way as \rmfamily, for example. If you would like to create a command that only changes the font inside its argument (i.e., the same behaviour as \emph) define it using regular LTFX commands:

```
\newcommand\textnote[1]{{\notefont #1}}
\textnote{This is a note.}
```

Note that the double braces are intentional; the inner pair are used to to delimit the scope of the font change.

```
Example 2: Defining new font families.

\text{newfontfamily\notefont{Kurier}}

This is a note. \text{notefont This is a \emph{note}.}
```

\newfontface

Sometimes only a specific font face is desired, without accompanying italic or bold variants being automatically selected. This is common when selecting a fancy italic font, say, that has swash features unavailable in the upright forms. \newfontface is used for this purpose, shown in Example 3, which is repeated in Section 22.4 on page 63.

Comment for advanced users: The commands defined by \newfontface and \newfontfamily include their encoding information, so even if the document is set to use a legacy TeX encoding, such commands will still work correctly. For example,

```
\documentclass{article}
\usepackage{fontspec}
\newfontfamily\unicodefont{Lucida Grande}
\usepackage{mathpazo}
\usepackage[T1]{fontenc}
\begin{document}
A legacy \TeX\ font. {\unicodefont A unicode font.}
\end{document}
```

6.1 More control over font shape selection

```
BoldFont = \langle font \ name \rangle
ItalicFont = \langle font \ name \rangle
BoldItalicFont = \langle font \ name \rangle
SlantedFont = \langle font \ name \rangle
BoldSlantedFont = \langle font \ name \rangle
SmallCapsFont = \langle font \ name \rangle
```

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose among. The BoldFont and ItalicFont features are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the *new* font. See Example 4.

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the BoldItalicFont feature is provided.

Example 3: Defining a single font face.	
\newfontfaceHoefler Text Ital [Contextuals={WordInitial,WordFi	
where is all the vegemite	\fancy where is all the vegemite % \emph, \textbf, etc., all don't work

Example 4: Explicit selection of the bold font.

6.1.1 Small caps and slanted font shapes

When a font family has both slanted *and* italic shapes, these may be specified separately using the analogous features SlantedFont and BoldSlantedFont. Without these, however, the Lagrange for slanted (\textsl, \slshape) will default to the italic shape.

Pre-OpenType, it was common for font families to be distributed with small caps glyphs in separate fonts, due to the limitations on the number of glyphs allowed in the PostScript Type I format. Such fonts may be used by declaring the SmallCapsFont of the family you are specifying:

```
\setmainfont{Minion MM Roman}[
   SmallCapsFont={Minion MM Small Caps & Oldstyle Figures}]
Roman 123 \\ \textsc{Small caps 456}
```

In fact, you should specify the small caps font for each individual bold and italic shape as in

```
\setmainfont{ <upright> }[
   UprightFeatures = { SmallCapsFont={ <sc> } } ,
   BoldFeatures = { SmallCapsFont={ <bf sc> } } ,
   ItalicFeatures = { SmallCapsFont={ <it sc> } } ,
   BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } } ,
   BoldItalicFeatures = { SmallCapsFont={ <bf it sc> } } ,
}
```

For most modern fonts that have small caps as a font feature, this level of control isn't generally necessary.

All of the bold, italic, and small caps fonts can be loaded with different font features from the main font. See Section II for details. When an OpenType font is selected for SmallCapsFont, the small caps font feature is *not* automatically enabled. In this case, users should write instead, if necessary,

```
\setmainfont{...}[
   SmallCapsFont={...},
   SmallCapsFeatures={Letters=SmallCaps},
]
```

6.2 Specifically choosing the NFSS family

In LTEX's NFSS, font families are defined with names such as 'ppl' (Palatino), 'lmr' (Latin Modern Roman), and so on, which are selected with the \fontfamily command:

```
\fontfamily{ppl}\selectfont
```

In fontspec, the family names are auto-generated based on the fontname of the font; for example, writing \fontspec{Times New Roman} for the first time would generate an internal font family name of 'TimesNewRoman(1)'. Please note that should not rely on the name that is generated.

In certain cases it is desirable to be able to choose this internal font family name so it can be re-used elsewhere for interacting with other packages that use the LaTeX's font selection interface; an example might be

```
\usepackage{fancyvrb}
\fvset{fontfamily=myverbatimfont}
```

To select a font for use in this way in fontspec use the NFSSFamily feature:

\newfontfamily\verbatimfont[NFSSFamily=myverbatimfont]{Inconsolata}

It is then possible to write commands such as:

```
\fontfamily{myverbatimfont}\selectfont
```

which is essentially the same as writing \verbatimfont, or to go back to the orginal example:

```
\fvset{fontfamily=myverbatimfont}
```

Only use this feature when necessary; the in-built font switching commands that fontspec generates (such as \verbatimfont in the example above) are recommended in all other cases.

If you don't wish to explicitly set the NFSS family but you would like to know what it is, an alternative mechanism for package writers is introduced as part of the fontspec programming interface; see the function \fontspec_set_family:Nnn for details (Section 27 on page 69).

6.3 Choosing additional NFSS font faces

ETEX's font selection scheme (NFSS) is more flexible than the fontspec interface discussed up until this point. It assigns to each font face a *family* (discussed above), a *series* such as bold or light or condensed, and a *shape* such as italic or slanted or small caps. The fontspec features such as BoldFont and so on all assign faces for the default series and shapes of the NFSS, but it's not uncommon to have font families that have multiple weights and shapes and so on.

If you set up a regular font family with the 'standard four' (upright, bold, italic, and bold italic) shapes and then want to use, say, a light font for a certain document element, many users will be perfectly happy to use \newfontface\\switch\\ and use

¹Thanks to Luca Fascione for the example and motivation for finally implementing this feature.

the resulting font \\subsetext{switch}\. In other cases, however, it is more convenient or even necessary to load additional fonts using additional NFSS specifiers.

```
FontFace = \{\langle series \rangle\} \{\langle shape \rangle\} \{ \} Font = \langle font \ name \rangle \} FontFace = \{\langle series \rangle\} \{\langle shape \rangle\} \{\langle font \ name \rangle\}
```

The font thus specified will inherit the font features of the main font, with optional additional $\langle features \rangle$ as requested. (Note that the optional $\{\langle features \rangle\}$ argument is still surrounded with curly braces.) Multiple FontFace commands may be used in a single declaration to specify multiple fonts. As an example:

```
\setmainfont{font1.otf}[
  FontFace = {c}{\updefault}{ font2.otf } ,
  FontFace = {c}{m}{ Font = font3.otf , Color = red }
]
```

Writing \fontseries{c}\selectfont will result in font2 being selected, which then followed by \fontshape{m}\selectfont will result in font3 being selected (in red). A font face that is defined in terms of a different series but an upright shape (\updatupdefault, as shown above) will attempt to find a matching small caps feature and define that face as well. Conversely, a font face defined in terms of a non-standard font shape will not.

There are some standards for choosing shape and series codes; the LaTeX 2ε font selection guide² lists series m for medium, b for bold, bx for bold extended, sb for semibold, and c for condensed. A far more comprehensive listing is included in Appendix A of Philipp Lehman's 'The Font Installation Guide'³ covering 14 separate weights and 12 separate widths.

The FontFace command also interacts properly with the SizeFeatures command as follows: (nonsense set of font selection choices)

Note that if the first Font feature is omitted then each size needs its own inner Font declaration.

6.3.1 An example for \strong

If you wanted to set up a font family to allow nesting of the \strong to easily access increasing font weights, you might use a declaration along the following lines:

³texdoc fontinstallationguide

```
UprightFont = *-Light ,
BoldFont = *-Regular ,
FontFace = {k}{n}{*-Black} ,
]
\strongfontdeclare{\bfseries,\fontseries{k}\selectfont}
```

Further 'syntactic sugar' is planned to make this process somewhat easier.

6.4 Math(s) fonts

When \setmainfont, \setsansfont and \setmonofont are used in the preamble, they also define the fonts to be used in maths mode inside the \mathrm-type commands. This only occurs in the preamble because LaTEX freezes the maths fonts after this stage of the processing. The fontspec package must also be loaded after any maths font packages (e.g., euler) to be successful. (Actually, it is only euler that is the problem.4)

Note that fontspec will not change the font for general mathematics; only the upright and bold shapes will be affected. To change the font used for the mathematical symbols, see either the mathspec package or the unicode-math package.

Note that you may find that loading some maths packages won't be as smooth as you expect since fontspec (and X₃T_EX in general) breaks many of the assumptions of T_EX as to where maths characters and accents can be found. Contact me if you have troubles, but I can't guarantee to be able to fix any incompatibilities. The Lucida and Euler maths fonts should be fine; for all others keep an eye out for problems.

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use the commands above (in the same way as our other \fontspec-like commands) to explicitly state which fonts to use inside such commands as \mathrm. Additionally, the \setboldmathrm command allows you define the font used for \mathrm when in bold maths mode (which is activated with, among others, \boldmath).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage{mathpazo}
\usepackage{fontspec}
\setmainfont{Optima}
\setmathrm{Optima}
\setboldmathrm[BoldFont={Optima ExtraBlack}]{Optima Bold}
```

These commands are compatible with the unicode-math package. Having said that, unicode-math also defines a more general way of defining fonts to use in maths mode, so you can ignore this subsection if you're already using that package.

⁴Speaking of euler, if you want to use its [mathbf] option, it won't work, and you'll need to put this after fontspec is loaded instead: \AtBeginDocument{\DeclareMathAlphabet\mathbf{U}{eur}{b}{n}

7 Miscellaneous font selecting details

The optional argument — from v2.4 For the first decade of fontspec's life, optional font features were selected with a bracketed argument before the font name, as in:

```
\setmainfont[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
]{myfont.otf}
```

This always looked like ugly syntax to me, because the most important detail — the name of the font — was tucked away at the end. The order of these arguments has now been reversed:

```
\setmainfont{myfont.otf}[
  lots and lots ,
  and more and more ,
  an excessive number really ,
  of font features could go here
]
```

I hope this doesn't cause any problems.

- 1. Backwards compatibility has been preserved, so either input method works.
- 2. In fact, you can write

```
\fontspec[Ligatures=Rare] \{ myfont.otf \} [Color=red]
```

if you really felt like it and both sets of features would be applied.

3. Following standard xparse behaviour, there must be no space before the opening bracket; writing

```
\fontspec{myfont.otf}_{\sqcup}[Color=red]
```

will result in [Color=red] not being recognised an argument and therefore it will be typeset as text. When breaking over lines, write either of:

```
\fontspec{myfont.otf}% \fontspec{myfont.otf}[
[Color=red] Color=Red]
```

Spaces \fontspec and \addfontfeatures ignore trailing spaces as if it were a 'naked' control sequence; e.g., 'M. \fontspec{...} N' and 'M. \fontspec{...}N' are the same.

Part III

Selecting font features

The commands discussed so far such as \fontspec each take an optional argument for accessing the font features of the requested font. Commands are provided to set default features to be applied for all fonts, and even to change the features that a font is presently loaded with. Different font shapes can be loaded with separate features, and different features can even be selected for different sizes that the font appears in. This part discusses these options.

8 Default settings

```
\defaultfontfeatures{\langle font features \rangle}
```

It is sometimes useful to define font features that are applied to every subsequent font selection command. This may be defined with the \defaultfontfeatures command, shown in Example 5. New calls of \defaultfontfeatures overwrite previous ones, and defaults can be reset by calling the command with an empty argument.

Default font features can be specified on a per-font and per-face basis by using the optional argument to \defaultfontfeatures as shown.

```
\defaultfontfeatures[texgyreadventor-regular.otf]{Color=blue}
\setmainfont{texgyreadventor-regular.otf}% will be blue
```

Multiple fonts may be affected by using a comma separated list of font names.

New in v2.4. Defaults can also be applied to symbolic families such as those created with the $\mbox{newfontfamily}$ command and for $\mbox{rmfamily}$, $\mbox{sffamily}$, and \ttfamily :

```
\defaultfontfeatures[\rmfamily,\sffamily]{Ligatures=TeX}
\setmainfont{texgyreadventor-regular.otf}% will use standard TeX ligatures
```

Example 5: A demonstration of the \defaultfontfeatures command.

```
\fontspec{texgyreadventor-regular.otf}
Some default text 0123456789 \\
\defaultfontfeatures{
    Numbers=OldStyle, Color=888888
}
\fontspec{texgyreadventor-regular.otf}
Now grey, with old-style figures:
0123456789
```

Some default text 0123456789

Now grey, with old-style figures: 0123456789

The line above to set TeX-like ligatures is now activated by *default* in fontspec.cfg. To reset default font features, simply call the command with an empty argument:

```
\defaultfontfeatures[\rmfamily,\sffamily]{}
\setmainfont{texgyreadventor-regular.otf}% will no longer use standard TeX ligatures
```

```
\label{lem:defaultfontfeatures} $$ \defaultfontfeatures+{\langle font features \rangle} $$ \defaultfontfeatures+{\langle font name \rangle} {\langle font features \rangle} $$
```

New in v2.4. Using the + form of the command appends the $\langle font \, features \rangle$ to any already-selected defaults.

9 Default settings from a file

In addition to the defaults that may be specified in the document as described above, when a font is first loaded, a configuration file is searched for with the name '\(\langle fontspec'.\)5

The contents of this file can be used to specify default font features without having to have this information present within each document. \(\lambda fontname \rangle \) is stripped of spaces and file extensions are omitted; for example, the line above for TEX Gyre Adventor could be placed in a file called TeXGyreAdventor.fontspec, or for specifying options for texgyreadventor-regular.otf (when loading by filename), the configuration file would be texgyreadventor-regular.fontspec. (N.B. the lettercase of the names should match.)

This mechanism can be used to define custom names or aliases for your font collections. If you create a file MyCharis.fontspec containing, say,

```
\defaultfontfeatures[My Charis]
{
   Extension = .ttf ,
   UprightFont = CharisSILR,
   BoldFont = CharisSILB,
   ItalicFont = CharisSILI,
   BoldItalicFont = CharisSILBI,
   % <any other desired options>
}
```

you can load that custom family with \fontspec{My Charis} and similar. The optional argument to \defaultfontfeatures must match that requested by the font loading command (\fontspec, etc.), else the options won't take effect.

Finally, note that options for font faces can also be defined in this way. To continue the example above, here we colour the different faces:

```
\defaultfontfeatures[CharisSILR]{Color=blue}
\defaultfontfeatures[CharisSILB]{Color=red}
```

And such configuration lines can be stored either inline inside My Charis.fontspec or within their own .fontspec files; in this way, fontspec is designed to handle 'nested' configuration options as well.

⁵Located in the current folder or within a standard texmf location.

10 Working with the currently selected features

```
\label{lem:likelihood} $$ \If Font Feature \end{superseq} $$ {\langle true\ code \rangle} $$ {\langle false\ code \rangle} $$
```

This command queries the currently selected font face and executes the appropriate branch based on whether the *\(font feature \)* as specified by fontspec is currently active. For example, the following will print 'True':

```
\setmainfont{texgyrepagella-regular.otf}[Numbers=OldStyle] \IfFontFeatureActiveTF{Numbers=OldStyle}{True}{False}
```

Note that there is no way for fontspec to know what the default features of a font will be. For example, by default the texgyrepagella fonts use lining numbers. But in the following example, querying for lining numbers returns false since they have not been explicitly requested:

```
\setmainfont{texgyrepagella-regular.otf}
\IfFontFeatureActiveTF{Numbers=Lining}{True}{False}
```

Please note: At time of writing this function only supports OpenType fonts; AAT/Graphite fonts under the X∃TEX engine are not supported.

This command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in Example 6. If you attempt to *change* an already-selected feature, fontspec will try to deactivate any features that clash with the new ones. *E.g.*, the following two invocations are mutually exclusive:

```
\addfontfeature{Numbers=OldStyle}...
\addfontfeature{Numbers=Lining}...
123
```

Since Numbers=Lining comes last, it takes precedence and deactivates the call Numbers=OldStyle. This command may also be executed under the alias \addfontfeature.

\addfontfeature

10.1 Priority of feature selection

Features defined with \addfontfeatures override features specified by \fontspec, which in turn override features specified by \defaultfontfeatures. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (.log) file displaying the font name and the features requested.

Example 6: A demonstration of the \addfontfeatures command.

```
\fontspec{texgyreadventor-regular.otf}%
                                                              [Numbers={Proportional,OldStyle}]
                                                     `In 1842, 999 people sailed 97 miles in
                                                      13 boats. In 1923, 111 people sailed 54
                                                      miles in 56 boats.'
'In 1842, 999 people sailed 97 miles in 13 boats. In
                                                     {\addfontfeatures{Numbers={Monospaced,Lining}}}
                                                     \begin{tabular}{@{} cccc @{}}
                                                               Year & People & Miles & Boats \\
                                                       \hline 1842 & 999
                                                                             & 75
                                                                                     & 13
                                                               1923 & 111
                                                                                        56
                                                                             &
                                                                                54
                                                                                      &z.
                                                     \end{tabular}}
```

Year People Miles **Boats** 999 75 13 1842 54 1923 111 56

1923, 111 people sailed 54 miles in 56 boats.

Different features for different font shapes 11

```
BoldFeatures={\langle features\rangle}
ItalicFeatures={\langle features\rangle}
BoldItalicFeatures={\langle features\rangle}
SlantedFeatures={\langle features \rangle}
BoldSlantedFeatures={\( features \) \}
SmallCapsFeatures = \{\langle features \rangle\}
```

It is entirely possible that separate fonts in a family will require separate options; e.g., Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional \fontspec argument are applied to all shapes of the family. Using Upright-, SmallCaps-, Bold-, Italic-, and BoldItalicFeatures, separate font features may be defined to their respective shapes in addition to, and with precedence over, the 'global' font features. See Example 7.

Note that because most fonts include their small caps glyphs within the main font, features specified with SmallCapsFeatures are applied in addition to any other shape-specific features as defined above, and hence SmallCapsFeatures can be nested within ItalicFeatures and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the somewhat ludi-

```
Example 7: Features for, say, just italics.
                         \fontspec{EBGaramond12-Regular.otf}%
                            [ItalicFont=EBGaramond12-Italic.otf]
Don't Ask Victoria!
                         \itshape Don't Ask Victoria! \\
Don't Ask Victoria!
                         \addfontfeature{ItalicFeatures={Style=Swash}}
                         Don't Ask Victoria! \\
```

Selecting fonts from TrueType Collections (TTC files)

TrueType Collections are multiple fonts contained within a single file. Each font within a collection must be explicitly chosen using the FontIndex command. Since TrueType Collections are often used to contain the italic/bold shapes in a family, fontspec automatically selects the italic, bold, and bold italic fontfaces from the same file. For example, to load the macOS system font Optima:

```
\setmainfont{Optima.ttc}[
  Path = /System/Library/Fonts/ ,
  UprightFeatures = {FontIndex=0} ,
  BoldFeatures = {FontIndex=1} ,
  ItalicFeatures = {FontIndex=2} ,
  BoldItalicFeatures = {FontIndex=3} ,
}
```

Support for TrueType Collections has only been tested in X₄TeX, but should also work with an up-to-date version of LuaTeX and the luaotfload package.

13 Different features for different font sizes

```
SizeFeatures = {
    ...
    { Size = \langle size range \rangle, \langle font features \rangle },
    { Size = \langle size range \rangle, Font = \langle font name \rangle, \langle font features \rangle },
    ...
}
```

The SizeFeature feature is a little more complicated than the previous features discussed. It allows different fonts and different font features to be selected for a given font family as the point size varies.

It takes a comma separated list of braced, comma separated lists of features for each size range. Each sub-list must contain the Size option to declare the size range, and optionally Font to change the font based on size. Other (regular) fontspec features that are added are used on top of the font features that would be used anyway. A demonstration to clarify these details is shown in Example 9. A less trivial example is shown in the context of optical font sizes in Section 14.6 on page 31.

To be precise, the Size sub-feature accepts arguments in the form shown in Table I on page 27. Braces around the size range are optional. For an exact font size (Size=X) font sizes chosen near that size will 'snap'. For example, for size definitions at exactly IIPt and I4Pt, if a I2Pt font is requested *actually* the IIPt font will be selected. This is a remnant of the past when fonts were designed in metal (at obviously rigid sizes) and later when bitmap fonts were similarly designed for fixed sizes.

Example 8: An example of setting the SmallCapsFeatures separately for each font shape.

```
\fontspec{texgyretermes}[
                                      Extension = {.otf},
                                      UprightFont = {*-regular}, ItalicFont = {*-italic},
                                      BoldFont = {*-bold}, BoldItalicFont = {*-bolditalic},
                                      UprightFeatures={Color = 220022,
                                            SmallCapsFeatures = {Color=115511}},
                                        ItalicFeatures={Color = 2244FF,
                                            SmallCapsFeatures = {Color=112299}},
                                         BoldFeatures={Color = FF4422,
                                            SmallCapsFeatures = {Color=992211}},
                                   BoldItalicFeatures={Color = 888844,
                                            SmallCapsFeatures = {Color=444422}},
Upright Small Caps
                                   Upright {\scshape Small Caps}\\
Italic Italic Small Caps
                                   \itshape Italic {\scshape Italic Small Caps}\\
Bold Bold Small Caps
                                   \upshape\bfseries Bold {\scshape Bold Small Caps}\\
Bold Italic Bold Italic Small Caps
                                  \itshape Bold Italic {\scshape Bold Italic Small Caps}
```

Example 9: An example of specifying different font features for different sizes of font with SizeFeatures.

If additional features are only required for a single size, the other sizes must still be specified. As in:

```
SizeFeatures={
    {Size=-10,Numbers=Uppercase},
    {Size=10-}}
```

Otherwise, the font sizes greater than 10 won't be defined at all!

Interaction with other features For SizeFeatures to work with ItalicFeatures,
BoldFeatures, etc., and SmallCapsFeatures, a strict heirarchy is required:

Suggestions on simplifying this interface welcome.

14 Font independent options

Features introduced in this section may be used with any font.

14.1 Colour

Color (or Colour) uses font specifications to set the colour of the text. You should think of this as the literal glyphs of the font being coloured in a certain way. Notably, this mechanism is different to that of the color/xcolor/hyperref/etc. packages, and in fact using fontspec commands to set colour will prevent your text from changing colour using those packages at all! For example, if you set the colour in a \setmainfont

Table 1: Syntax for specifying the size to apply custom font features.

Input	Font size, s
Size = X-	$s \geq X$
Size = -Y	$s < \mathtt{Y}$
Size = X-Y	$\mathtt{X} \leq s < \mathtt{Y}$
Size = X	s = X

command, \color{...} and related commands, including hyperlink colouring, will no longer have any effect on text in this font.) Therefore, fontspec's colour commands are best used to set explicit colours in specific situations, and the xcolor package is recommended for more general colour functionality.

The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where <code>%%</code> is completely transparent and FF is opaque.) Transparency is supported by Lual-TeX; XqL-TeX with the xdvipdfmx driver does not support this feature.

If you load the xcolor package, you may use any named colour instead of writing the colours in hexadecimal.

```
\usepackage{xcolor}
...
\fontspec[Color=red]{Verdana} ...
\definecolor{Foo}{rgb}{\0.3,\0.4,\0.5}
\fontspec[Color=Foo]{Verdana} ...
```

The color package is *not* supported; use xcolor instead.

You may specify the transparency with a named colour using the Opacity feature which takes an decimal from zero to one corresponding to transparent to opaque respectively:

```
\fontspec[Color=red,Opacity=0.7]{Verdana} ...
```

It is still possible to specify a colour in six-char hexadecimal form while defining opacity in this way, if you like.

14.2 Scale

```
Scale = \langle number \rangle
Scale = MatchLowercase
Scale = MatchUppercase
```

In its explicit form, Scale takes a single numeric argument for linearly scaling the font, as demonstrated in Example 1. It is now possible to measure the correct dimensions of the fonts loaded and calculate values to scale them automatically.

As well as a numerical argument, the Scale feature also accepts options MatchLowercase and MatchUppercase, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively; these features are shown in Example II.

Example 10: Selecting colour with transparency.

\fontsize{48}{48}

\fontspec{texgyrebonum-bold.otf} {\addfontfeature{Color=FF000099}W}\kern-0.4ex

{\addfontfeature{Color=QQBB3399}R}

Example 11: Automatically calculated scale values.

\setmainfont{Georgia}
\newfontfamily\lc[Scale=MatchLowercase]{Verdana}
The perfect match {\lc is hard to find.}\\
\newfontfamily\uc[Scale=MatchUppercase]{Arial}
L O G O \uc F O N T

The perfect match is hard to find. LOGOFONT

The amount of scaling used in each instance is reported in the .log file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

Note that when Scale=MatchLowercase is used with \setmainfont, the new 'main' font of the document will be scaled to match the old default. This may be undesirable in some cases, so to achieve 'natural' scaling for the main font but automatically scale all other fonts selected, you may write

```
\defaultfontfeatures{ Scale = MatchLowercase }
\defaultfontfeatures[\rmfamily]{ Scale = 1}
```

One or both of these lines may be placed into a local fontspec.cfg file (see Section 3.3 on page 7) for this behaviour to be effected in your own documents automatically. (Also see Section 8 on page 21 for more information on setting font defaults.)

14.3 Interword space

While the space between words can be varied on an individual basis with the TEX primitive \spaceskip command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically, and generally will not need to be adjusted. For those times when the precise details are important, the WordSpace feature is provided, which takes either a single scaling factor to scale the default value, or a triplet of comma-separated values to scale the nominal value, the stretch, and the shrink of the interword space by, respectively. (WordSpace= $\{x\}$ is the same as WordSpace= $\{x,x,x\}$.)

Note that TEX's optimisations in how it loads fonts means that you cannot use this feature in \addfontfeatures.

14.4 Post-punctuation space

If \frenchspacing is *not* in effect, TEX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The PunctuationSpace feature takes a scaling factor by which to adjust the nominal value chosen for the font; this is demonstrated in Example 13. Note that PunctuationSpace=@\(\) is *not* equivalent to \frenchspacing, although the difference will only be apparent when a line of text is under-full.

Example 12: Scaling the default interword space. An exaggerated value has been chosen to emphasise the effects here.

> \fontspec{texgyretermes-regular.otf} Some text for our example to take up some space, and to demonstrate the default interword space. \bigskip

Some text for our example to take up some space, and to demonstrate the default interword space.

 $\label{lem:continuous} $$ \ \operatorname{contspec}(texgyreschola-regular.otf}[PunctuationSpace=\emptyset] $$$

Letters, Words. Sentences.

Note that TEX's optimisations in how it loads fonts means that you cannot use this feature in \addfontfeatures.

14.5 The hyphenation character

The letter used for hyphenation may be chosen with the HyphenChar feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string None, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

This package redefines LaTeX's \- macro such that it adjusts along with the above changes.

Note that TeX's optimisations in how it loads fonts means that you cannot use this feature in \addfontfeatures.

14.6 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by X_{\(\frac{1}{2}\)TeX and LuaTeX *automatically* determined by the current font size as in Example 15, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes.}

The OpticalSize option may be used to specify a different optical size. With OpticalSize set to zero, no optical size font substitution is performed, as shown in Example 16.

The SizeFeatures feature (Section 13 on page 25) can be used to specify exactly which optical sizes will be used for ranges of font size. For example, something like:

Example 14: Explicitly choosing the hyphenation character.

	Example 15: A	demonstration of automatic optical size selection.
	omatic optical size	/scarebox(d.+) (/iidge
Latin Modern optical size	\for Lat \for Lat cal sizes \for Lat	tical size substitution is suppressed when set to zero. atspec{Latin Modern Roman 5 Regular}[OpticalSize=0] in Modern optical sizes \\ itspec{Latin Modern Roman 8 Regular}[OpticalSize=0] in Modern optical sizes \\ atspec{Latin Modern Roman 12 Regular}[OpticalSize=0] in Modern optical sizes \\ in Modern optical sizes \\
Latin Modern optical sizes Latin Modern optical sizes		tspec{Latin Modern Roman 17 Regular}[OpticalSize=0]

14.7 Font transformations

In rare situations users may want to mechanically distort the shapes of the glyphs in the current font such as shown in Example 17. Please don't overuse these features; they are *not* a good alternative to having the real shapes.

If values are omitted, their defaults are as shown above.

If you want the bold shape to be faked automatically, or the italic shape to be slanted automatically, use the AutoFakeBold and AutoFakeSlant features. For example, the following two invocations are equivalent:

```
\fontspec[AutoFakeBold=1.5]{Charis SIL}
\fontspec[BoldFeatures={FakeBold=1.5}]{Charis SIL}
```

Example 17: Articifial font transformations.		
		\fontspec{Charis SIL} \emph{ABCxyz} \fontspec{Charis SIL}[FakeSlant=0.2] ABCxyz
ABCxyz	ABCxyz	\fontspec{Charis SIL} ABCxyz \fontspec{Charis SIL}[FakeStretch=1.2] ABCxyz
•	ABCxyz ABCxyz	\fontspec{Charis SIL} \textbf{ABCxyz} \fontspec{Charis SIL}[FakeBold=1.5] ABCxyz

If both of the AutoFake... features are used, then the bold italic font will also be faked.

The FakeBold and AutoFakeBold features are only available with the X₃T_EX engine and will be ignored in LuaT_EX.

14.8 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the LetterSpace, which takes a numeric argument, shown in Example 18.

The letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of '1.0' will add 0.1 pt between each letter.

This functionality is not generally used for lowercase text in modern typesetting but does have historic precedent in a variety of situations. In particular, small amounts of letter spacing can be very useful, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature (Section 16.2 on page 36).

Part IV

OpenType

15 Introduction

OpenType fonts (and other 'smart' font technologies such as AAT and Graphite) can change the appearance of text in many different ways. These changes are referred to as font features. When the user applies a feature — for example, small capitals — to a run of text, the code inside the font makes appropriate substitutions and small capitals appear in place of lowercase letters. However, the use of such features does not affect the underlying text. In our small caps example, the lowercase letters are still stored in the document; only the appearance has been changed by the OpenType feature. This makes it possible to search and copy text without difficulty. If the user selected a different font that does not support small caps, the 'plain' lowercase letters would appear instead.

Some OpenType features are required to support particular scripts, and these features are often applied automatically. The Indic scripts, for example, often require that characters be reshaped and reordered after they are typed by the user, in order to display them in the traditional ways that readers expect. Other features can be applied to support a particular language. The Junicode font for medievalists uses by default the Old English shape of the letter thorn, while in modern Icelandic thorn has a more rounded shape. If a user tags some text as being in Icelandic, Junicode will automatically change to the Icelandic shape through an OpenType feature that localises the shapes of letters.

There are a large group of OpenType features, designed to support high quality typography a multitude of languages and writing scripts. Examples of some font features have already been shown in previous sections; the complete set of OpenType font features supported by fontspec is described below in Section 16.

The OpenType specification provides four-letter codes (e.g., smcp for small capitals) for each feature. The four-letter codes are given below along with the fontspec names for various features, for the benefit of people who are already familiar with OpenType. You can ignore the codes if they don't mean anything to you.

15.1 How to select font features

Font features are selected by a series of \(\frac{feature}{=} = \langle option \rangle \) selections. Features are (usually) grouped logically; for example, all font features relating to ligatures are accessed by writing Ligatures={...} with the appropriate argument(s), which could be TeX, Rare, etc., as shown below in 16.1.1.

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; Numbers={OldStyle,Lining} doesn't make much sense because the two options are mutually exclusive, and XqTeX will simply use the last option that is specified (in this case using Lining over OldStyle).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in Section 3.4 on page 8 these warnings can be

suppressed by selecting the [quiet] package option.

15.2 How do I know what font features are supported by my fonts?

Although I've long desired to have a feature within fontspec to display the OpenType features within a font, it's never been high on my priority list. One reason for that is the existence of the document opentype-info.tex, which is available on CTAN or typing kpsewhich opentype-info.tex in a Terminal window. Make a copy of this file and place it somewhere convenient. Then open it in your regular TeX editor and change the font name to the font you'd like to query; after running through plain XaTeX, the output PDF will look something like this:

```
OpenType Layout features found in '[Asana-Math.otf]'
script = 'DFLT'
    \mathsf{language} = \langle \mathsf{default} \rangle
        features = 'onum' 'salt' 'kern'
script = 'cher'
    language = \langle default \rangle
        features = 'onum' 'salt' 'kern'
script = 'grek'
    language = \langle default \rangle
        features = 'onum' 'salt' 'kern'
script = 'latn'
    language = \langle default \rangle
        features = 'onum' 'salt' 'kern'
script = 'math'
    language = \langle default \rangle
        features = 'dtls' 'onum' 'salt' 'ssty' 'kern'
```

I intentionally picked a font that by design needs few font features; 'regular' text fonts such as Latin Modern Roman contain many more, and I didn't want to clutter up the document too much. You'll then need to cross-check the OpenType feature tags with the 'logical' names used by fontspec.

otfinfo Alternatively, and more simply, you can use the command line tool otfinfo, which is distributed with TEXLive. Simply type in a Terminal window, say:

```
otfinfo -f `kpsewhich lmromandunh1@-oblique.otf`
```

which results in:

```
aalt Access All Alternates
cpsp Capital Spacing
dlig Discretionary Ligatures
frac Fractions
```

kern	Kerning			
liga	Standard Ligatures			
lnum	Lining Figures			
onum	Oldstyle Figures			
pnum	Proportional Figures			
size	Optical Size			
tnum	Tabular Figures			
zero	Slashed Zero			

16 OpenType font features

There are a finite set of OpenType font features, and fontspec provides an interface to around half of them. Full documentation will be presented in the following sections, including how to enable and disable individual features, and how they interact.

A brief reference is provided (Table 2 on the following page) but note that this is an incomplete listing — only the 'enable' keys are shown, and where alternative interfaces are provided for convenience only the first is shown. (E.g., Numbers=OldStyle is the same as Numbers=Lowercase.)

For completeness, the complete list of OpenType features *not* provided with a fontspec interface is shown in Table 3 on page 38. Features omitted are partially by design and partially by oversight; for example, the aalt feature is largely useless in TEX since it is designed for providing a textscgui interface for selecting 'all alternates' of a glyph. Others, such as optical bounds for example, simply haven't yet been considered due to a lack of fonts available for testing. Suggestions welcome for how/where to add these missing features to the package.

16.1 Tag-based features

16.1.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. The list of options, of which multiple may be selected at one time, is shown in Table 4. A demonstration with the Linux Libertine fonts⁶ is shown in Example 19.

Note the additional features accessed with Ligatures=TeX. These are not actually real OpenType features, but additions provided by luaotfload (i.e., LuaTeX only) to emulate TeX's behaviour for ASCII input of curly quotes and punctuation. In XaTeX this is achieved with the Mapping feature (see Section 21.1 on page 61) but for consistency Ligatures=TeX will perform the same function as Mapping=tex-text.

16.2 Letters

The Letters feature specifies how the letters in the current font will look. Open-Type fonts may contain the following options: Uppercase, SmallCaps, PetiteCaps, UppercaseSmallCaps, UppercasePetiteCaps, and Unicase.

⁶http://www.linuxlibertine.org/

Table 5: Options for the OpenType font feature 'Letters'.

Feature	Option	Tag	
Letters =	Uppercase	case	†
	SmallCaps	smcp	†
	PetiteCaps	pcap	+
	UppercaseSmallCaps	c2sc	+
	UppercasePetiteCaps	c2pc	+
	Unicase	${\tt unic}$	†
	ResetAll		

[†] These feature options can be disabled with . .Off variants, and reset to default state (neither explicitly on nor off) with . .Reset.

Petite caps are smaller than small caps. SmallCaps and PetiteCaps turn lowercase letters into the smaller caps letters, whereas the Uppercase... options turn the *capital* letters into the smaller caps (good, *e.g.*, for applying to already uppercase acronyms like 'NASA'). This difference is shown in Example 20. 'Unicase' is a weird hybrid of upper and lower case letters.

Note that the Uppercase option will (probably) not actually map letters to uppercase. It is designed to select various uppercase forms for glyphs such as accents and dashes, such as shown in Example 21; note the raised position of the hyphen to better match the surrounding letters.

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see Section 16.5 on page 45).

16.2.1 Numbers

The Numbers feature defines how numbers will look in the selected font, accepting options shown in Table 6.

The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 10 on page 23. The Monospaced option is useful for tabular material when digits need to be vertically aligned.

The SlashedZero option replaces the default zero with a slashed version to prevent confusion with an uppercase 'O', shown in Example 22.

The Arabic option (with tag anum) maps regular numerals to their Arabic script or Persian equivalents based on the current Language setting (see Section 16.9 on page 50). This option is based on a LuaTEX feature of the luaotfload package, not an OpenType feature. (Thus, this feature is unavailable in XTEX.)

16.2.2 Contextuals

This feature refers to substitutions of glyphs that vary 'contextually' by their relative position in a word or string of characters; features such as contextual swashes are accessed via the options shown in Table 7.

Historic forms are accessed in OpenType fonts via the feature Style=Historic; this is generally *not* contextual in OpenType, which is why it is not included in this feature.

[†] These feature options can be disabled with . .Off variants, and reset to default state (neither explicitly on nor off) with . .Reset.

16.2.3 Vertical Position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option will only raise characters that are used in some languages directly after a number. The ScientificInferior feature will move glyphs further below the baseline than the Inferior feature. These are shown in Example 23

Numerator and Denominator should only be used for creating arbitrary fractions (see next section).

The realscripts package (which is also loaded by xltxtra for $X_{\overline{A}}T_{\overline{E}}X$) redefines the \textsubscript and \textsuperscript commands to use the above font features automatically, including for use in footnote labels. If this is the only feature of xltxtra you wish to use, consider loading realscripts on its own instead.

16.2.4 Fractions

For OpenType fonts use a regular text slash to create fractions, but the Fraction feature must be explicitly activated. Some (Asian fonts predominantly) also provide for the Alternate feature. These are both shown in Example 24.

 $^{^7\}mbox{If you want automatic uppercase letters, look to $\mbox{\sc LME}$X's \mbox{\sc MakeUppercase}$ command.}$

16.3 Style

Ruby' refers to a small optical size, used in Japanese typography for annotations. For fonts with multiple salt OpenType features, use the fontspec Alternate feature instead.

Example 25 and Example 26 both contain glyph substitutions with similar characteristics. Note the occasional inconsistency with which font features are labelled; a long-tailed 'Q' could turn up anywhere!

In other features, larger breadths of changes can be seen, covering the style of an entire alphabet. See Example 27 and Example 28; in the latter, the Italic option affects the Latin text and the Ruby option the Japanese.

Note the difference here between the default and the horizontal style kana in Example 29: the horizontal style is slightly wider.

Example 25: Example of the	Alternate option of the Style feature.

16.4 Diacritics

Specifies how combining diacritics should be placed. These will usually be controlled automatically according to the Script setting.

16.5 Kerning

Specifies how inter-glyph spacing should behave. Well-made fonts include information for how differing amounts of space should be inserted between separate character pairs. This kerning space is inserted automatically but in rare circumstances you may wish to turn it off.

As briefly mentioned previously at the end of Section 16.2 on page 36, the Uppercase option will add a small amount of tracking between uppercase letters, seen in Example 30, which uses the Romande fonts⁸ (thanks to Clea F. Rees for the suggestion). The Uppercase option acts separately to the regular kerning controlled by the On/Off options.

16.6 Character width

Many Asian fonts are equipped with variously spaced characters for shoe-horning into their generally monospaced text. These are accessed through the CharacterWidth feature.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms seen in Example 32.

 $[\]dagger$ These feature options can be disabled with . . Off variants, and reset to default state (neither explicitly on nor off) with . . Reset.

16.6.1 CJK shape

There have been many standards for how CJK ideographic glyphs are 'supposed' to look. Some fonts will contain many alternate glyphs available in order to be able to display these gylphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

16.7 Vertical typesetting

OpenType provides a plethora of features for accommodating the varieties of possibilities needed for vertical typesetting (CJK and others). No capabilities for achieving such vertical typesetting are provided by fontspec, however; please get in touch if there are improvements that could be made.

16.8 Numeric features

16.8.1 Stylistic Set variations — ssnn

This feature selects a 'Stylistic Set' variation, which usually corresponds to an alternate glyph style for a range of characters (usually an alphabet or subset thereof). This feature is specified numerically. These correspond to OpenType features ss@1, ss@2, etc.

Two demonstrations from the Junicode font⁹ are shown in Example 34 and Example 35; thanks to Adam Buchbinder for the suggestion.

Multiple stylistic sets may be selected simultaneously by writing, e.g., StylisticSet={1,2,3}.

The StylisticSet feature is a synonym of the Variant feature for AAT fonts. See Section 23 on page 67 for a way to assign names to stylistic sets, which should be done on a per-font basis.

16.8.2 Character Variants — cvNN

Similar to the 'Stylistic Sets' above, 'Character Variations' are selected numerically to adjust the output of (usually) a single character for the particular font. These correspond to the OpenType features cv\01 to cv\99.

Example 33: Different standards for CJK ideograph presentation.

---	---

For each character that can be varied, it is possible to select among possible options for that particular glyph. For example, in Example 36 a variety of glyphs for the character 'v' are selected, in which 5 corresponds to the character 'v' for this font feature, and the trailing : $\langle n \rangle$ corresponds to which variety to choose. Georg Duffner's open source Garamond revival font¹⁰ is used in this example. Character variants are specifically designed not to conflict with each other, so you can enable them individually per character as shown in Example 37. (Unlike stylistic alternates, say.)

Note that the indexing starts from zero.

16.8.3 Alternates - salt

The Alternate feature, alias StylisticAlternates, is used to access alternate font glyphs when variations exist in the font, such as in Example 38. It uses a numerical selection, starting from zero, that will be different for each font. Note that the Style=Alternate option is equivalent to Alternate=Q to access the default case.

Note that the indexing starts from zero. With the LuaTeX engine, Alternate=Random selects a random alternate.

See Section 23 on page 67 for a way to assign names to alternates if desired.

16.8.4 Annotation — nalt

Some fonts are equipped with an extensive range of numbers and numerals in different forms. These are accessed with the Annotation feature (OpenType feature nalt), selected numerically as shown in Example 39. Note that the indexing starts from zero.

16.8.5 Ornament — ornm

Ornaments are selected with the Ornament feature (OpenType feature ornm), selected numerically such as for the Annotation feature. If you know of an Open Source font that supports this feature, let me know and I'll add an example.

16.9 OpenType scripts and languages

Fonts that include glyphs for various scripts and languages may contain different font features for the different character sets and languages they support, and different font features may behave differently depending on the script or language chosen. When multilingual fonts are used, it is important to select which language they are being used for, and more importantly what script is being used.

The 'script' refers to the alphabet in use; for example, both English and French use the Latin script. Similarly, the Arabic script can be used to write in both the Arabic and Persian languages.

The Script and Language features are used to designate this information. The possible options are tabulated in Table 16 on page 53 and Table 17 on page 54, respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Because these font features can change which features are able to be selected for the font, they are automatically selected by fontspec before all others and, if X₃T_EX is

being used, will specifically select the OpenType renderer for this font, as described in Section 21.2 on page 61.

See Section 24 on page 68 for methods to create new Script or Language options if required.

16.9.1 Script and Language examples

In the examples shown in Example 40, the Code2000 font¹¹ is used to typeset various input texts with and without the OpenType Script applied for various alphabets. The text is only rendered correctly in the second case; many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

Part V

Commands for accents and symbols ('encodings')

The functionality described in this section is experimental.

In the pre-Unicode era, significant work was required by LTEX to ensure that input characters in the source could be interpreted correctly depending on file encoding, and that glyphs in the output were selected correctly depending on the font encoding. With Unicode, we have the luxury of a single file and font encoding that is used for both input and output.

While this may provide some illusion that we could get away simply with typing Unicode text and receive correct output, this is not always the case. For a start, hyphenation in particular is language-specific, so tags should be used when switch between languages in a document. The babel and polyglossia packages both provide features for this.

Multilingual documents will often use different fonts for different languages, not just for style, but for the more pragmatic reason that fonts do not all contain the same glyphs. (In fact, only test fonts such as Code2000 provide anywhere near the full Unicode coverage.) Indeed, certain fonts may be perfect for a certain application but miss a handful of necessary diacritics or accented letters. In these cases, fontspec can leverage the font encoding technology built into LaTeX2 to provide on a per-font basis either provide fallback options or error messages when a desired accent or symbol is not available. However, at present these features can only be provided for input using LaTeX commands rather than Unicode input; for example, typing \`e instead of \ealpha or \textcopyright instead of \ealpha in the source file.

The most widely-used encoding in \LaTeX 2 $_{\mathcal{E}}$ was T1 with companion 'TS1' symbols provided by the textcomp package. These encodings provided glyphs to typeset text in a variety of western European languages. As with most legacy \LaTeX 2 $_{\mathcal{E}}$ input methods, accents and symbols were input using encoding-dependent commands such as \`e as described above. As of 2017, in \LaTeX 2 $_{\mathcal{E}}$ on చ and LuaTeX, the default encoding is TU, which uses Unicode for input and output. The TU encoding provides appropriate encoding-dependent definitions for input commands to match the coverage of the T1+TS1 encodings. Wider coverage is not provided by default since (a) each font will provide different glyph coverage, and (b) it is expected that most users will be writing with direct Unicode input.

For those users who do need finer-grained control, fontspec provides an interface for a more extensible system.

17 A new Unicode-based encoding from scratch

Let's say you need to provide support for a document originally written with fonts in the OT2 encoding, which contains encoding-dependent commands for Cyrillic letters. An example from the OT2 encoding definition file (ot2enc.def) reads:

```
\DeclareTextSymbol{\CYRIE}{0T2}{5}
\DeclareTextSymbol{\CYRDJE}{0T2}{6}
\DeclareTextSymbol{\CYRTSHE}{0T2}{7}
\DeclareTextSymbol{\cyrnje}{0T2}{8}
\DeclareTextSymbol{\cyrnje}{0T2}{9}
\DeclareTextSymbol{\cyrdzhe}{0T2}{10}
```

To recreate this encoding in a form suitable for fontspec, create a new file named, say, fontrange-cyr.def and populate it with

```
\DeclareTextSymbol{\CYRIE} {\LastDeclaredEncoding}{"\04\04\} \DeclareTextSymbol{\CYRDJE} {\LastDeclaredEncoding}{"\04\02\} \DeclareTextSymbol{\CYRTSHE}{\LastDeclaredEncoding}{"\04\08\} \DeclareTextSymbol{\cyrnje} {\LastDeclaredEncoding}{"\04\5A} \DeclareTextSymbol{\cyrlje} {\LastDeclaredEncoding}{"\04\59} \DeclareTextSymbol{\cyrdzhe}{\LastDeclaredEncoding}{"\04\5F}
```

The numbers "Q4Q4, "Q4Q2, ..., are the Unicode slots (in hexadecimal) of each glyph respectively. The fontspec package provides a number of shorthands to simplify this style of input; in this case, you could also write

```
\EncodingSymbol{\CYRIE}{"0404}
...
```

To use this encoding in a fontspec font, you would first add this to your preamble:

```
\DeclareUnicodeEncoding{unicyr}{
  \input{fontrange-cyr.def}
}
```

Then follow it up with a font loading call such as

```
\setmainfont{...}[NFSSEncoding=unicyr]
```

The first argument unicyr is the name of the 'encoding' to use in the font family. (There's nothing special about the name chosen but it must be unique.) The second argument to \DeclareUnicodeEncoding also allows adjustments to be made for perfont changes. We'll cover this use case in the next section.

18 Adjusting a pre-existing encoding

There are three reasons to adjust a pre-existing encoding: to add, to remove, and to redefine some symbols, letters, and/or accents.

When adding symbols, etc., simply write

```
\DeclareUnicodeEncoding{unicyr}{
  \input{tuenc.def}
  \input{fontrange-cyr.def}
  \EncodingSymbol{\textruble}{"2\BD}}
```

Of course if you consistently add a number of symbols to an encoding it would be a good idea to create a new fontrange-XX.def file to suit your needs.

When removing symbols, use the \UndeclareSymbol{ $\langle cmd \rangle$ } command. For example, if you a loading a font that you know is missing, say, the interrobang (not that unusual a situation), you might write:

```
\DeclareUnicodeEncoding{nobang}{
  \input{tuenc.def}
  \UndeclareSymbol\textinterrobang
}
```

Provided that you use the command \textinterrobang to typeset this symbol, it will appear in fonts with the default encoding, while in any font loaded with the nobang encoding an attempt to access the symbol will either use the default fallback definition or return an error, depending on the symbol being undeclared.

The third use case is to redefine a symbol or accent. The most common use case in this scenario is to adjust a specific accent command to either fine-tune its placement or to 'fake' it entirely. For example, the underdot diacritic is used in typeset Sanskrit, but it is not necessarily included as an accent symbol is all fonts. By default the underdot is defined in TU as:

```
\EncodingAccent{d}{"0323}
```

For fonts with a missing (or poorly-spaced) "0323 accent glyph, the 'traditional' TEX fake accent construction could be used instead:

```
\DeclareUnicodeEncoding{fakeacc}{
  \input{tuenc.def}
  \EncodingCommand{\d}[1]{%
    \hmode@bgroup
    \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}%
    \egroup
  }
}
```

This would be set up in a document as such:

```
\newfontfamily\sanskitfont{CharisSIL}
\newfontfamily\titlefont{Posterama}[NFSSEncoding=fakeacc]
```

Then later in the document, no additional work is needed:

```
...{\titlefont kalita\d m}... % <- uses fake accent
...{\sanskitfont kalita\d m}... % <- uses real accent</pre>
```

To reiterate from above, typing this input with Unicode text ('kalitam') will *bypass* this encoding mechanism and you will receive only what is contained literally within the font.

19 Summary of commands

The $\text{MEX}\ 2\varepsilon$ kernel provides the following font encoding commands suitable for Unicode encodings:

See fntguide.pdf for full documentation of these. As shown above, the following shorthands a provided by fontspec to simplify the process of defining Unicode font range encodings:

Despite its name, \UndeclareSymbol can be used for commands defined by all three of \EncodingCommand, \EncodingAccent, and \EncodingSymbol.

Part VI

LuaT_EX-only font features

20 Custom font features

Pre-2016, it was possible to load an OpenType font feature file to define new OpenType features for a selected font. This facility was particularly useful to implement custom substitutions, for example. As of TeXLive 2016, LuaTeX/luaotfload no longer supports this feature, but provides its own internal mechanisms for an equivalent interface.

Any documents using 'feature file' options will need to transition to the new interface. Figure ${\tt I}$ shows an example. Please refer to the LuaTeX/luaotfload documentation for more details.

Figure 1: An example of custom font features.

Part VII

Fonts and features with X_HT_EX

21 X₃T_EX-only font features

The features described here are available for any font selected by fontspec.

21.1 Mapping

Mapping enables a X¬T¬EX text-mapping scheme, shown in Example 41.

Only one mapping can be active at a time and a second call to Mapping will simply override the first. Using the tex-text mapping is also equivalent to writing Ligatures=TeX. The use of the latter syntax is recommended for better compatibility with LuaTeX documents.

21.2 Different font technologies: AAT and OpenType

X₃T_EX supports two rendering technologies for typesetting, selected with the Renderer font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, OpenType, is an open source OpenType interpreter.¹² It provides greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the OpenType renderer is used automatically, and for AAT fonts, AAT is chosen by default. Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, OpenType provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see Section 16.9 on page 50 for the description of these features. Because these font features can change which features are able to be selected for the font instance, they are selected by fontspec before all others and will automatically and without warning select the OpenType renderer.

21.3 Optical font sizes

Multiple Master fonts are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size. Whereas an Open-Type font will have only a few separate optical sizes, a Multiple Master font's optical

¹²v2.4: This was called 'ICU' in previous versions of X₃T_EX and fontspec. Backwards compatibility is preserved.

Example 41: X <u>-</u> T <u>F</u>	ZY's Mapping feature.
"¡A small amount of—text!"	\fontspec{Cochin}[Mapping=tex-text] ``!`A small amount oftext!''

size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through LaTeX, and the optical size for a Multiple Master font must always be specified explicitly.

```
\fontspec{Minion MM Roman}[OpticalSize=11]
MM optical size test  \\
\fontspec{Minion MM Roman}[OpticalSize=47]
MM optical size test  \\
\fontspec{Minion MM Roman}[OpticalSize=71]
MM optical size test  \\
```

22 Mac OS X's AAT fonts

Warning! X₃T_EX's implementation on Mac OS X is currently in a state of flux and the information contained below may well be wrong from 2013 onwards. There is a good chance that the features described in this section will not be available any more as X₃T_EX's completes its transition to a cross-platform-only application.

Mac OS X's font technology began life before the ubiquitous-OpenType era and revolved around the Apple-invented 'AAT' font format. This format had some advantages (and other disadvantages) but it never became widely popular in the font world.

Nonetheless, this is the font format that was first supported by $X_{\exists}T_{\exists}X$ (due to its pedigree on Mac OS X in the first place) and was the first font format supported by fontspec. A number of fonts distributed with Mac OS X are still in the AAT format, such as 'Skia'.

22.1 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old TEX trick of splitting up a ligature with an empty brace pair does not work in XTEX; you must use a opt kern or \hbox (e.g., \null) to split the characters up if you do not want a ligature to be performed (the usual examples for when this might be desired are words like 'shelffull').

22.2 Letters

The Letters feature specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

22.3 Numbers

The Numbers feature defines how numbers will look in the selected font. For AAT fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced

(the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 10 on page 23.

22.4 Contextuals

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here. The options for AAT fonts are WordInitial, WordFinal (Example 42), LineInitial, LineFinal, and Inner (Example 43, also called 'non-final' sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

22.5 Vertical position

The VerticalPosition feature is used to access things like subscript (Inferior) and superscript (Superior) numbers and letters (and a small amount of punctuation, sometimes). The Ordinal option is (supposed to be) contextually sensitive to only raise characters that appear directly after a number. These are shown in Example 44.

The realscripts package (also loaded by xltxtra) redefines the \textsubscript and \textsuperscript commands to use the above font features, including for use in footnote labels.

22.6 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned On or Off in both AAT and OpenType fonts.

In AAT fonts, the 'fraction slash' or solidus character, is to be used to create fractions. When Fractions are turned On, then only pre-drawn fractions will be used. See Example 45.

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters.

Some (Asian fonts predominantly) also provide for the Alternate feature shown in Example 46.

22.7 Variants

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don't mind my fancy Example 47:) I'm just looping through the nine (!) variants of Zapfino.

Example 42: Contextual glyph for the beginnings and ends of words.	
	\newfontface\fancy{Hoefler Text Italic}[%
where is all the vegemite	<pre>Contextuals={WordInitial,WordFinal}]</pre>
	\fancy where is all the vegemite

Example 43: A contextual feature for the 'long s' can be convenient as the character does not need to be marked up explicitly.

\fontspec{Hoefler Text}[Contextuals=Inner] 'Inner' fwashes can sometimes `Inner' swashes can \emph{sometimes} contain the archaic long s. contain the archaic long~s.

Example 44	: Vertical position for AA	Γ fonts.
	\fontspec{Skia}	
	Normal	
	\fontspec{Skia}[V	<pre>[erticalPosition=Superior]</pre>
	Superior	
	\fontspec{Skia}[V	<pre>[erticalPosition=Inferior]</pre>
Normal superior inferior 1st 2 nd 3 rd 4 th O th 8 ^{abcde}	Inferior	\\
	\fontspec{Skia}[V	erticalPosition=Ordinal]
	1st 2nd 3rd 4th	Qth 8abcde

Example 45: Fractions in AAT fonts. The $^{---}2044$ glyph is the 'fraction slash' that may be typed in Mac OS X with $\mbox{opt+shift+1}$; not shown literally here due to font contraints.

\fontspec[Fractions=On]{Skia} $1{^{\mbox{\mbox{$\sim$}}}}2044}2 \neq 5{^{\mbox{\mbox{\sim}}}}6 \neq \%$ fraction slash 1/2 \quad 5/6 % regular slash 5/6 1/2 5/6 \fontspec[Fractions=Diagonal]{Skia} 13579/24680 $13579\{^{\circ\circ\circ}2044\}24680\ \backslash\backslash\ \%$ fraction slash 13579/24680 \quad 13579/24680 % regular slash

Example 46: Alternate design of pre-composed fractions.

\fontspec{Hiragino Maru Gothic Pro} 1/2 \quad 1/4 \quad 5/6 \quad 13579/2468\\ 5/6 13579/24680 \addfontfeature{Fractions=Alternate} 13579/24680 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680

Example 47: Nine variants of Zapfino.

\newcounter{var}
\whiledo{\value{var}<9}{%
 \edef\1{%
 \noexpand\fontspec[Variant=\thevar,
 Color=0099\thevar\thevar]{Zapfino}}\1%
 \makebox[0.75\width]{d}%
 \stepcounter{var}}
\hspace*{2cm}</pre>

See Section 23 on page 67 for a way to assign names to variants, which should be done on a per-font basis.

22.8 Alternates

Selection of Alternates *again* must be done numerically; see Example 48. See Section 23 on page 67 for a way to assign names to alternates, which should be done on a per-font basis.

22.9 Style

The options of the Style feature are defined in AAT as one of the following: Display, Engraved, IlluminatedCaps, Italic, Ruby, ¹³ TallCaps, or TitlingCaps.

Typical examples for these features are shown in Section 16.3.

22.10 CJK shape

There have been many standards for how CJK ideographic glyphs are 'supposed' to look. Some fonts will contain many alternate glyphs in order to be able to display these gylphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options: Traditional, Simplified, JIS1978, JIS1983, JIS1998, and Expert. OpenType also supports the NLC option.

Example 48: Alternate shape selection must be numerical.

Sphinx Of Black Quartz, Judge Mr Vow Sphinx Of Black Quartz, Judge Mr Vow \fontspec{Hoefler Text Italic}[Alternate=0]
Sphinx Of Black Quartz, {\scshape Judge My Vow} \\
\fontspec{Hoefler Text Italic}[Alternate=1]
Sphinx Of Black Quartz, {\scshape Judge My Vow}

¹³ 'Ruby' refers to a small optical size, used in Japanese typography for annotations.

22.11 Character width

See Section 16.6 on page 45 for relevant examples; the features are the same between OpenType and AAT fonts. AAT also allows CharacterWidth=Default to return to the original font settings.

22.12 Vertical typesetting

X-TEX provides for vertical typesetting simply with the ability to rotate the individual glyphs as a font is used for typesetting, as shown in Example 49.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the X¬TEX documentation.

22.13 Diacritics

Diacritics are marks, such as the acute accent or the tilde, applied to letters; they usually indicate a change in pronunciation. In Arabic scripts, diacritics are used to indicate vowels. You may either choose to Show, Hide or Decompose them in AAT fonts. The Hide option is for scripts such as Arabic which may be displayed either with or without vowel markings. E.g., \fontspec[Diacritics=Hide] { . . . }

Some older fonts distributed with Mac OS X included '0/' etc. as shorthand for writing 'Ø' under the label of the Diacritics feature. If you come across such fonts, you'll want to turn this feature off (imagine typing hello/goodbye and getting 'helløgoodbye' instead!) by decomposing the two characters in the diacritic into the ones you actually want. I recommend using the proper Lagar input conventions for obtaining such characters instead.

22.14 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and DoubleCircle.

Example 49: Vertical typesetting.

共産主義者は

共産主義者

\fontspec{Hiragino Mincho Pro} \verttext

\fontspec{Hiragino Mincho Pro}[Renderer=AAT,Vertical=RotatedGlyphs]\rotatebox{-90}{\verttext}% requires the graphicx package

Part VIII

Customisation and programming interface

This is the beginning of some work to provide some hooks that use fontspec for various macro programming purposes.

23 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

\newAATfeature

\newopentypefeature

New AAT features may be created with this command:

New OpenType features may be created with this command:

\newopentypefeature{\langle feature \rangle \{ \langle option \rangle \} \{ \langle feature \tag \} \}

The synonym \newICUfeature is deprecated.

Here's what it would look like in practise:

\newopentypefeature{Style}{NoLocalForms}{-locl}

\newfontfeature

In case the above commands do not accommodate the desired font feature (perhaps a new X_TT_EX feature that fontspec hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

```
\newfontfeature{\langle name \rangle} {\langle input string \rangle}
```

For example, Zapfino used to contain an AAT feature 'Avoid d-collisions'. To access it with this package, you could do some like the following:

```
\newfontfeature{AvoidD} {Special= Avoid d-collisions}
\newfontfeature{NoAvoidD}{Special=!Avoid d-collisions}
\fontspec{Zapfino}[AvoidD, Variant=1]
    sockdolager rubdown \\
\fontspec{Zapfino}[NoAvoidD, Variant=1]
    sockdolager rubdown
```

The advantage to using the \newAATfeature and \newopentypefeature commands instead of \newfontfeature is that they check if the selected font actually

contains the desired font feature at load time. By contrast, \newfontfeature will not give a warning for improper input.

24 Defining new scripts and languages

\newfontscript \newfontlanguage

While the scripts and languages listed in Table 16 and Table 17 are intended to be comprehensive, there may be some missing; alternatively, you might wish to use different names to access scripts/languages that are already listed. Adding scripts and languages can be performed with the \newfontscript and \newfontlanguage commands. For example,

```
\newfontscript{Arabic}{arab}
\newfontlanguage{Zulu}{ZUL}
```

The first argument is the fontspec name, the second the OpenType tag. The advantage to using these commands rather than \newfontfeature (see Section 23 on the preceding page) is the error-checking that is performed when the script or language is requested.

25 Going behind fontspec's back

Expert users may wish not to use fontspec's feature handling at all, while still taking advantage of its Later font selection conveniences. The RawFeature font feature allows font feature selection using a literal feature selection string if you happen to have the OpenType feature tag memorised.

Multiple features can either be included in a single declaration:

[RawFeature=+smcp;+onum]

or with multiple declarations:

[RawFeature=+smcp, RawFeature=+onum]

26 Renaming existing features & options

\aliasfontfeature

If you don't like the name of a particular font feature, it may be aliased to another with the \alias fontfeature { $\langle existing\ name \rangle$ } { $\langle new\ name \rangle$ } command, such as shown in Example 52.

Spaces in feature (and option names, see below) *are* allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

If you wish to change the name of a font feature option, it can be aliased to another

\aliasfontfeatureoption

Example 51: Using raw font features directly.

\[\fontspec\{texgyrepagella-regular.otf}\{ [RawFeature=+smcp] \] \] Pagella small caps

Example	52: Renaming font features.
Roman Letters And Swash	\aliasfontfeature{ItalicFeatures}{IF} \fontspec{Hoefler Text}[IF = {Alternate=1}] Roman Letters \itshape And Swash
Example 53:	: Renaming font feature options.

\aliasfontfeature{VerticalPosition}{Vert Pos} \aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf} \fontspec{LinLibertine_R.otf}[Vert Pos=Sci Inf] Scientific Inferior: 12345

Scientific Inferior: 12345

with the command \alias font feature option { $\langle font feature \rangle$ } { $\langle existing name \rangle$ } { $\langle new \rangle$ } name}, such as shown in Example 53.

This example demonstrates an important point: when aliasing the feature options, the original feature name must be used when declaring to which feature the option

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Color specification. For this type of thing, the \newfontfeature command should be used to declare a new, e.g., PurpleColor feature:

\newfontfeature{PurpleColor}{color=550099BB}

Except that this example was written before support for named colours was implemented. But you get the idea.

Programming interface

Variables 27.1

\l_fontspec_family_tl \l_fontspec_font In some cases, it is useful to know what the LATEX font family of a specific fontspec font is. After a \fontspec-like command, this is stored inside the \l_fontspec_family_tl macro. Otherwise, LaTeX's own \f@family macro can be useful here, too. The raw TeX font that is defined from the 'base' font in the family is stored in \l_fontspec_font.

\g_fontspec_encoding_tl

Package authors who need to load fonts with legacy LTEX NESS commands may also need to know what the default font encoding is. Since this has changed from EU1/EU2 to TU, it is best to use the variables \g_fontspec_encoding_tl or \UTFencname instead.

Functions for loading new fonts and families 27.2

\fontspec_set_family:Nnn #1 : LATEX family

#2 : fontspec features

#3: font name

Defines a new NFSS family from given $\langle features \rangle$ and $\langle font \rangle$, and stores the family name in the variable $\langle family \rangle$. This font family can then be selected with standard MEX commands \fontfamily{ $\langle family \rangle$ }\selectfont. See the standard fontspec user commands for applications of this function.

\fontspec_set_fontface:NNnn

#1 : primitive font

#2 : LATEX family

#3 : fontspec features

#4: font name

Variant of the above in which the primitive TEX font command is stored in the variable $\langle primitive\ font \rangle$. If a family is loaded (with bold and italic shapes) the primitive font command will only select the regular face. This feature is designed for Lagranger programmers who need to perform subsequent font-related tests on the $\langle primitive\ font \rangle$.

27.3 Conditionals

The following functions in expl3 syntax may be used for writing code that interfaces with fontspec-loaded fonts. The following conditionals are all provided in TF, T, and F forms.

27.3.1 Querying font families

\fontspec_font_if_exist:nTF

Test whether the 'font name' (#1) exists or is loadable. The syntax of #1 is a restricted/simplified version of fontspec's usual font loading syntax; fonts to be loaded by filename are detected by the presence of an appropriate extension (.otf, etc.), and paths should be included inline. E.g.:

```
\fontspec_font_if_exist:nTF {cmr10}{T}{F}
\fontspec_font_if_exist:nTF {Times~ New~ Roman}{T}{F}
\fontspec_font_if_exist:nTF {texgyrepagella-regular.otf}{T}{F}
\fontspec_font_if_exist:nTF {/Users/will/Library/Fonts/CODE2000.TTF}{T}{F}
```

The synonym \IfFontExistsTF is provided for 'document authors'.

\fontspec_if_fontspec_font:TF

Test whether the currently selected font has been loaded by fontspec.

\fontspec_if_opentype:TF

Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts

\fontspec_if_small_caps:TF

Test whether the currently selected font has a 'small caps' face to be selected with \scshape or similar. Note that testing whether the font has the Letters=SmallCaps font feature is sufficient but not necessary for this command to return true, since small caps can also be loaded from separate font files. The logic of this command is complicated by the fact that fontspec will merge shapes together (for italic small caps, etc.).

27.3.2 Availability of features

fontspec_if_aat_feature:nnTF	Test whether the currently selected font contains the AAT feature (#1,#2).
\fontspec_if_feature:nTF	Test whether the currently selected font contains the raw OpenType feature #1. E.g.: \fontspec_if_feature:nTF {pnum} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_feature:nnnTF	Test whether the currently selected font with raw OpenType script tag #1 and raw OpenType language tag #2 contains the raw OpenType feature tag #3. E.g.: \fontspec_if_feature:nnnTF { Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_script:nTF	Test whether the currently selected font contains the raw OpenType script #1. E.g.: \fontspec_if_script:nTF {latn} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nTF	Test whether the currently selected font contains the raw OpenType language tag #1. E.g.: \fontspec_if_language:nTF {ROM} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
\fontspec_if_language:nnTF	Test whether the currently selected font contains the raw OpenType language tag #2 in script #1. E.g.: \fontspec_if_language:nnTF {cyrl} {SRB} {True} {False}. Returns false if the font is not loaded by fontspec or is not an OpenType font.
	27.3.3 Currently selected features
tspec_if_current_feature:nTF	Test whether the currently loaded font is using the specified raw OpenType feature tag #1. The tag string #1 should be prefixed with + to query an active feature, and with a – (hyphen) to query a disabled feature.
ntspec_if_current_script:nTF	Test whether the currently loaded font is using the specified raw OpenType script tag #1.
spec_if_current_language:nTF	Test whether the currently loaded font is using the specified raw OpenType language

Part IX

Implementation

28 Loading

```
The expl3 module is fontspec.
 Check engine and load specific modules. For LuaTeX, load luaotfload.
 3\sys_if_engine_luatex:T
   { \RequirePackage{luaotfload}
      \directlua{require("fontspec")}
      \RequirePackageWithOptions{fontspec-luatex} \endinput }
 7\sys_if_engine_xetex:T
 8 { \RequirePackageWithOptions{fontspec-xetex} \endinput }
If not one of the above, error:
 9\msg_new:nnn {fontspec} {cannot-use-pdftex}
10 {
    The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX.\\\
    You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~ "xelatex"~ or~ "lualatex" instead
14 \msg_fatal:nn {fontspec} {cannot-use-pdftex}
15 \endinput
16 (/load)
```

29 Declaration of variables and functions

```
17 (*fontspec)
```

Booleans

firsttime As \keys_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occuring per-shape this no longer needs to happen; this is indicated by the 'firsttime' conditional.

```
18 \bool_new:N \l_@@_firsttime_bool

19 \bool_new:N \l_@@_nobf_bool
20 \bool_new:N \l_@@_noit_bool
21 \bool_new:N \l_@@_nosc_bool

These strange set functions are to simplify returning code from LuaTeX:

22 \bool_new:N \l_@@_check_bool
23 \cs_new:Npn \FontspecSetCheckBoolTrue { \bool_set_true:N \l_@@_check_bool }
24 \cs_new:Npn \FontspecSetCheckBoolFalse { \bool_set_false:N \l_@@_check_bool }
25 \bool_new:N \l_@@_tfm_bool
26 \bool_new:N \l_@@_atsui_bool
```

```
27 \bool_new:N \l_@@_ot_bool
28 \bool_new:N \l_@@_mm_bool
29 \bool_new:N \l_@@_graphite_bool
For dealing with legacy maths:
30 \bool_new:N \g_@@_math_euler_bool

31.2 Encodings

Soon to be the default, with a just-in-case check:

```
379 \bool_if:NF \g_@@_euenc_bool
380
       \file_if_exist:nTF {tuenc.def}
381
382
383
           \cs_if_exist:cF {T@TU}
384
             {
385
                \@@_warning:n {tu-clash}
386
                \DeclareFontEncoding{TU}{}{}
                \DeclareFontSubstitution{TU}{lmr}{m}{n}
387
388
         }
389
390
           \@@_warning:n {tu-missing}
391
           \bool_set_true:N \g_@@_euenc_bool
392
393
394
395 \bool_if:NTF \g_@@_euenc_bool
396
    {
397 (xetexx)
              \tl_set:Nn \g_fontspec_encoding_tl {EU1}
398 (luatex)
              \tl_set:Nn \g_fontspec_encoding_tl {EU2}
399 }
    { \tl_set:Nn \g_fontspec_encoding_tl { TU } }
401 \tl_set:Nn \rmdefault {lmr}
402 \tl_set:Nn \sfdefault {lmss}
403 \tl_set:Nn \ttdefault {lmtt}
404 \RequirePackage [\g_fontspec_encoding_tl] {fontenc}
405 \tl_set_eq:NN \UTFencname \g_fontspec_encoding_tl % for xunicode if needed
To overcome the encoding changing the current font size, but only if a class has been
loaded first:
406 \tl_if_in:NnT \@filelist {.cls} { \normalsize }
Dealing with a couple of the problems introduced by babel:
407 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
408 \tl_set_eq:NN \latinencoding
                                    \g_fontspec_encoding_tl
409 \AtBeginDocument
410 {
    \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
    \tl_set_eq:NN \latinencoding
                                       \g_fontspec_encoding_tl
413 }
That latin encoding definition is repeated to suppress font warnings. Something to do
with \select@language ending up in the .aux file which is read at the beginning of
the document.

33 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the 'top level' definitions of the commands are contained herein; they all use or define macros which are defined or used later on in Section 35.1 on page 97.

33.0.1 Font selection

 \fontspec

This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font. Then this new font family is selected.

```
458 \NewDocumentCommand \fontspec { O{} m O{} }
459 {
460 \@@_main_fontspec:nnn {#1} {#2} {#3}
461 }
462 \cs_set:\Nn \@@_main_fontspec:nnn
463 {
464 \fontspec_set_family:\Nnn \f@family {#1,#3} {#2}
465 \fontencoding { \l_@@_nfss_enc_tl }
466 \selectfont
467 \ignorespaces
468 }
```

\setmainfont

The following three macros perform equivalent operations setting the default font for a particular family: 'roman', sans serif, or typewriter (monospaced). I end them with \normalfont so that if they're used in the document, the change registers immediately.

```
469 \DeclareDocumentCommand \setmainfont { O{} m O{} }
470
    {
       \@@_main_setmainfont:nnn {#1} {#2} {#3}
471
472
473 \cs_set:Nn \@@_main_setmainfont:nnn
474 {
    \fontspec_set_family:Nnn \g_@@_rmfamily_family {#1,#3} {#2}
475
    \tl_set_eq:NN \rmdefault \g_@@_rmfamily_family
476
     \use:x { \exp_not:n { \DeclareRobustCommand \rmfamily }
477
478
       \exp_not:N \fontencoding { \l_@@_nfss_enc_tl }
479
       \exp_not:N \fontfamily { \g_@@_rmfamily_family }
480
       \exp_not:N \selectfont
481
     }
482
483
     \str_if_eq_x:nnT {\familydefault} {\rmdefault}
484
485
       { \tl_set_eq:NN \encodingdefault \l_@0_nfss_enc_tl }
     \normalfont
486
     \ignorespaces
487
488 }
```

\setsansfont

489 \DeclareDocumentCommand \setsansfont { O{} m O{} }

```
{
               490
                       \@@_main_setsansfont:nnn {#1} {#2} {#3}

                    \ignorespaces
               527
               This is the old name for \setmainfont, retained ad infinitum for backwards compati-
\setromanfont
                bility. It was deprecated in 2010.
               529 \DeclareDocumentCommand \setromanfont { O{} m O{} }
               530
                       \00_main_setmainfont:nnn {#1} {#2} {#3}
               531
                    }
               532
   \setmathrm
```

\setmathsf
\setboldmathrm
\setmathtt

These commands are analogous to \setmainfont and others, but for selecting the font used for \mathrm, etc. They can only be used in the preamble of the document.

\setboldmathrm is used for specifying which fonts should be used in \boldmath. 533 \DeclareDocumentCommand \setmathrm { O{} m O{} } 534 \@@_main_setmathrm:nnn {#1} {#2} {#3} 535 536 537 \cs_set:Nn \@@_main_setmathrm:nnn \fontspec_set_family:Nnn \g_00_mathrm_tl {#1} {#2} 540 } 541 \DeclareDocumentCommand \setboldmathrm { O{} m O{} } 542 \@@_main_setboldmathrm:nnn {#1} {#2} {#3} 543 } 544 545 \cs_set:Nn \@@_main_setboldmathrm:nnn 546 { \fontspec_set_family:Nnn \g_00_bfmathrm_tl {#1} {#2} 547 548 } $_{549}\$ \DeclareDocumentCommand \setmathsf { O{} m O{} } \@@_main_setmathsf:nnn {#1} {#2} {#3} 553 \cs_set:Nn \@@_main_setmathsf:nnn \fontspec_set_family:Nnn \g_@@_mathsf_tl {#1} {#2} 555 556 } $_{557}\DeclareDocumentCommand \setmathtt { O{} m O{} }$ \@@_main_setmathtt:nnn {#1} {#2} {#3} 559 561 \cs_set:Nn \@@_main_setmathtt:nnn 563 \fontspec_set_family:Nnn \g_@@_mathtt_tl {#1} {#2} 564 } 565 \@onlypreamble\setmathrm

If the commands above are not executed, then \rmdefault (etc.) will be used.

```
569 \tl_set:Nn \g_@@_mathrm_tl {\rmdefault}
570 \tl_set:Nn \g_@@_mathsf_tl {\sfdefault}
571 \tl_set:Nn \g_@@_mathtt_tl {\ttdefault}
```

566 \@onlypreamble\setboldmathrm 567 \@onlypreamble\setmathsf 568 \@onlypreamble\setmathtt

\newfontfamily This macro takes the arguments of \fontspec with a prepended \(\lambda instance cmd \rangle \). This command is used when a specific font instance needs to be referred to repetitively \((e.g., in a section heading)\) since continuously calling \fontspec_select:nn is inefficient because it must parse the option arguments every time.

 $\fontspec_select:nn\ defines\ a\ font\ family\ and\ saves\ its\ name\ in\ \l_fontspec_family_tl.$ This family is then used in a typical NFSS \fontfamily\ declaration, saved in the macro name specified.

```
572 \DeclareDocumentCommand \newfontfamily { m O{} m O{} }
573
       \@@_main_newfontfamily:nnnn {#1} {#2} {#3} {#4}
575
_{576}\cs_{set:Nn \ensuremath{\texttt{No}}\cs_{nnnn}}
     \label{lem:conform} $$ \int_{\mathbb{R}^n} g_0 - cs_t - str:\mathbb{N} +1 _family $$ $$ $$ $$ $$ $$
578
579
580
581
       \exp_not:N \DeclareRobustCommand \exp_not:N #1
582
583
          \exp_not:N \fontfamily { \use:c \{g_@@_ \cs_to_str:N #1 _family\} \}
584
          \exp_not:N \fontencoding { \l_@@_nfss_enc_tl }
          \exp_not:N \selectfont
585
586
      }
587
588 }
```

\newfontface \newfontface uses the fact that if the argument to BoldFont, etc., is empty (i.e., BoldFont={}), then no bold font is searched for.

33.0.2 Font feature selection

\defaultfontfeatures

This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent \fontspec, et al., commands. It stores its value in \g_fontspec_default_fontopts_tl (initialised empty), which is concatenated with the individual macro choices in the [...] macro.

```
597 \DeclareDocumentCommand \defaultfontfeatures { t+ o m }
    {
598
       \IfNoValueTF {#2}
599
        { \@@_set_default_features:nn {#1} {#3} }
600
        { \00\_set\_font\_default\_features:nnn {#1} {#2} {#3} }
601
       \ignorespaces
602
    }
603
604 \cs_new: Nn \@@_set_default_features:nn
605
       \IfBooleanTF {#1} \clist_put_right:Nn \clist_set:Nn
606
         \g @@ default fontopts clist {#2}
607
608
    }
```

The optional argument specifies a font identifier. Branch for either (a) single token input such as \rmdefault, or (b) otherwise assume its a fontname. In that case, strip spaces and file extensions and lower-case to ensure consistency.

```
609 \cs_new:Nn \00_set_font_default_features:nnn
610 {
                    \clist_map_inline:nn {#2}

626
                                                                                                                         \g_@@_fontopts_prop \1_@@_tmp_t1 {#3,} }
                                          { \prop_put:NVn
627
                                }
 628
                        }
 629
630 }
```

\addfontfeatures

In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level \fontspec command.

The default options are not applied (which is why \g_fontspec_default_fontopts_tl is emptied inside the group; this is allowed as \l_fontspec_family_tl is globally defined in \@@_select_font_family:nn), so this means that the only added features to the font are strictly those specified by this command.

\addfontfeature is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```
631 \DeclareDocumentCommand \addfontfeatures {m}
632 {
633 \QQ_main_addfontfeatures:n {#1}
634 }
635 \cs_set:Nn \QQ_main_addfontfeatures:n

33.0.3 Defining new font features

\newfontfeature

\newfontfeature takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

```
660 \DeclareDocumentCommand \newfontfeature {mm}
66т
       \@@_main_newfontfeature:nn {#1} {#2}
662
663
664 \cs_{set:Nn \c00_main_newfontfeature:nn}
665 {
     \keys_define:nn { fontspec }
666
667
       #1 .code:n =
668
669
         \@@_update_featstr:n {#2}
670
671
      }
672
673 }
```

\newAATfeature

This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better than \newfontfeature because it checks if the feature exists in the font it's being used for.

```
674 \DeclareDocumentCommand \newAATfeature \{mmm\}
675 \{
676 \QQ_main_newAATfeature:nnnn \{\pi\} \{\pi\} \{\pi\}
678 \cs_set:\Nn \QQ_main_newAATfeature:nnnn
679 \{
680 \keys_if_exist:nnF \{\fontspec\} \{\pi\}
681 \{\QQ_define_aat_feature_group:n \{\pi\}\}
682
```

```
{ \@@_warning:nxx {feature-option-overwrite} {#1} {#2} }
                       684
                       685
                       686
                            \label{local_define_aat_feature:nnnn} $$ $$ 0_{\text{define}_aat_feature:nnnn} $$ $$ $$ $$ $$ $$
                       This command assigns a new OpenType feature by its abbreviation (#2) to a new name
\newopentypefeature
                       (#1). Better than \newfontfeature because it checks if the feature exists in the font
                       it's being used for.
                       688 \DeclareDocumentCommand \newopentypefeature {mmm}

34 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via \fontspec or from a \newfontfamily macro or from \setmainfont and so on.)

\fontspec_if_fontspec_font:TF

Test whether the currently selected font has been loaded by fontspec.

\fontspec_if_aat_feature:nnTF

Conditional to test if the currently selected font contains the AAT feature (#1,#2).

```
825 \prg_new_conditional:Nnn \fontspec_if_aat_feature:nn {TF,T,F}
826 {
827
     \fontspec_if_fontspec_font:TF

                               #3: font name
                                   Defines a new font family from given \langle features \rangle and \langle font \rangle, and stores the name
                               in the variable \langle family \rangle. See the standard fontspec user commands for applications of
                                   We want to store the actual name of the font family within the \langle family \rangle variable
                               because the actual LTFX family name is automatically generated by fontspec and it's
                               easier to keep it that way.
                                   Please use \fontspec_set_family: Nnn instead of \@@_select_font_family:nn,
                               which may change in the future.

35 Internals

35.1 The main function for setting fonts

\@@_select_font_family:nn

This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l_fontspec_family_tl. The TEX '\font' command is (globally) stored in \l_fontspec_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- \l_fontspec_fontname_tl is used as the generic name of the font being defined.
- \l_@@_fontid_tl is the unique identifier of the font with all its features.
- \l_@@_fontname_up_tl is the font specifically to be used as the upright font.
- \1_@@_basename_tl is the (immutable) original argument used for *-replacing.
- \l_fontspec_font is the plain TEX font of the upright font requested.

\fontspec_select:nn This old name has been used by 3rd party packages so for compatibility:

 $\label{local_constraint} $_{1075} \le eq: NN \rightarrow \color= \color=$

\@@_sanitise_fontname:Nn Assigns font name #2 to token list variable #1 and strips extension(s) from it in the case of an external font. We strip spaces for luatex for consistency with luaotfload, although I'm not sure this is necessary any more. At one stage this also lowercased the name, but this step has been removed unless someone can remind me why it was necessary.

\@@_get_features:Nn This macro is a wrapper for \keys_set:nn which expands and adds a default specification to the original passed options. It begins by initialising the commands used to

hold font-feature specific strings. Its argument is any additional features to prepend to the default.

Do not set the colour if not explicitly spec'd else \color (using specials) will not work.

\@@_save_family_needed:nTF

Check if the family is unique and, if so, save its information. (\addfontfeature and other macros use this data.) Then the font family and its shapes are defined in the NFSS.

Now we have a unique (in fact, too unique!) string that contains the family name and every option in abbreviated form. This is used with a counter to create a simple NFSS family name for the font we're selecting.

35.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if \bfdefault is redefined to b, all bold shapes defined by this package will also be assigned to b.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then set_autofont will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

```

35.2.1 Fonts

\@@_set_font_type:

Now check if the font is to be rendered with ATSUI or Harfbuzz. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in \l_fontspec_font is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```

 $\00_set_autofont:Nnn #1 : Font name tl$

#2: Base font name

#3 : Font name modifier

This function looks for font with \(name \) and \(modifier \) #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like /B to look for a bold font, for example.

We can't match external fonts in this way (in XaTeX anyway; todo: test with Lua-TeX). If $\langle font \ name \ tl \rangle$ is not empty, then it's already been specified by the user so abort. If $\langle Base font name \rangle$ is not given, we also abort for obvious reasons.

If $\langle font \ name \ tl \rangle$ is empty, then proceed. If not found, $\langle font \ name \ tl \rangle$ remains empty. Otherwise, we have a match.

\@@_declare_shape_slanted:nn

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@_set_slanted: code will overwrite this anyway if necessary.

35.4 Miscellaneous

\@@_iv_str_to_num:Nn

This macro takes a four character string and converts it to the numerical representation required for X¬TEX OpenType script/language/feature purposes. The output is stored in #1.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc', 'ab', 'ab', 'etc. (It is assumed the first two chars are always not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \@empty s and anything beyond four chars is snipped. The \@empty s then are used to reconstruct the spaces in the string to number calculation.

36.1 Adding features when loading fonts

When remove clashing features,

- remove the feature being added (to avoid duplicates);
- 2. remove the inverse of the feature (to avoid cancellation);
- 3. finally remove all clashing features.

```

_make_AAT_feature_string:nnTF

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 112).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But X₃T_EX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to check the selector of the previous number, and then prefix the feature string with! to denote the switch.

Finally, save out the complete feature string in \l_fontspec_feature_string_tl.

2144 \@@_keys_define_code:nnn {fontspec} {FontIndex}
```

38.0.3 Bold/italic choosing options

2148 }

The Bold, Italic, and BoldItalic features are for defining explicitly the bold and italic fonts used in a font family.

Bold (NFSS) Series By default, fontspec uses the default bold series, \bfdefault. We want to be able to make this extensible.

```
2149 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSeries}
2150 {
2151 \tl_gset:Nx \g_@@_curr_series_tl { #1 }
2152 \seq_gput_right:Nx \g_@@_bf_series_seq { #1 }
```

```
2153 }
   Fonts Upright:
2154 \@@_keys_define_code:nnn {fontspec-preparse-external} {UprightFont}
2155 {
              \label{lem:lem:nn} $$ \end{substrate} $$ \end{sub
{\tt 2158 \ensuremath{\mbox{00\_keys\_define\_code:nnn}} \ \{fontspec-preparse-external\} \ \{FontName\}}
              \fontspec_complete_fontname: Nn \l_@@_fontname_up_tl {#1}
2161 }
   Bold:
2162 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldFont}
2163 {
               \tl_if_empty:nTF {#1}
2164
2165
                 {
                    \bool_set_true:N \l_@@_nobf_bool
2166
2167
                 {
2168
                    \bool_set_false:N \l_@@_nobf_bool
2169
                    \fontspec_complete_fontname: Nn \l_@@_curr_bfname_tl {#1}
                    \seq_if_empty:NT \g_@@_bf_series_seq
2172
                       {
2173
                          \tl_gset:Nx \g_@@_curr_series_tl {\bfdefault}
2174
                          \seq_put_right:Nx \g_00_bf_series_seq {\bfdefault}
2175
2176
                    \tl_if_eq:oxT \g_00_curr_series_tl {\bfdefault}
2177
                       { \tl_set_eq:NN \l_@0_fontname_bf_tl \l_@0_curr_bfname_tl }
2178
2179
{\tt 2180\ (debug) typeout \{Setting\ `bold\ `font\ ''\}\_@\_curr\_bfname\_tl"\ `with\ `series\ ''\}\_@@\_curr\_series\_tl"}\}
2181
                     \prop_put:NxV \1_@@_nfss_prop
2182
                       {BoldFont-\g_@@_curr_series_tl} \l_@@_curr_bfname_tl
2183
2184
2185
                 }
2186 }
   Same for italic:
2187 \@@_keys_define_code:nnn {fontspec-preparse-external} {ItalicFont}
               \tl_if_empty:nTF {#1}
2189
2190
                    \bool_set_true:N \l_@@_noit_bool
2191
                 }
2192
2193
                    \verb|\bool_set_false:N \l_@@_noit_bool|
2194
                    \fontspec_complete_fontname: Nn \l_@@_fontname_it_tl {#1}
2195
                 }
2196
2197 }
```

```
Simpler for bold+italic & slanted:
2198 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldItalicFont}
      \fontspec_complete_fontname: Nn \l_@0_fontname_bfit_tl {#1}
2201 }
2202 \@@_keys_define_code:nnn {fontspec-preparse-external} {SlantedFont}
2203 {
     \fontspec_complete_fontname: Nn \l_@@_fontname_sl_tl {#1}
2204
2205 }
2206 \@@_keys_define_code:nnn {fontspec-preparse-external} {BoldSlantedFont}
2207 {
     \fontspec_complete_fontname: Nn \l_@0_fontname_bfsl_tl {#1}
2208
2209 }
 Small caps isn't pre-parsed because it can vary with others above:
2210 \@@_keys_define_code:nnn {fontspec} {SmallCapsFont}
2211 {
     \tl_if_empty:nTF {#1}
2212
2213
        \bool_set_true:N \l_@@_nosc_bool
2214
       }
2215
2216
        \bool_set_false:N \l_@@_nosc_bool
2217
2218
        \fontspec_complete_fontname: Nn \l_@@_fontname_sc_tl {#1}
       }
2219
2220 }

2319 }
```

Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical. \fontspec_calc_scale:n does all the work in the auto-scaling cases.

```
2320 \@@_keys_define_code:nnn {fontspec} {Scale}
2321 {
2322 \str_case:nnF {#1}
2323 {
```

```
2324 {MatchLowercase} { \@@_calc_scale:n {5} }
2325 {MatchUppercase} { \@@_calc_scale:n {8} }
2326 }
2327 { \tl_set:Nx \l_@@_scale_tl {#1} }
2328 \tl_set:Nx \l_@@_scale_tl { s*[\l_@@_scale_tl] }
2329 }
```

\00_calc_scale:n

This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X-TFX).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```

2343
```

\@@_set_font_dimen:NnN

This function sets the dimension #1 (for font #3) to 'fontdimen' #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect 'zero' value (as \fontdimen8 might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an 'X' or an 'x'.

```
2344 \cs_new:Nn \@@_set_font_dimen:NnN
2345 {
      \dim_set:Nn #1 { \fontdimen #2 #3 }

38.o.6 Font transformations

These are to be specified to apply directly to a font shape:

```
2546 \keys_define:nn {fontspec}
2547 {
      FakeSlant .code:n =
2548
       {
2549
        \verb|\@Q_update_featstr:n{slant=#1}|
2550
       },
2551
      FakeSlant .default:n = \{0.2\}
2554 \keys_define:nn {fontspec}
2555 {
      FakeStretch .code:n =
2556
2557
         \@@_update_featstr:n{extend=#1}
2558
       },
2559
      FakeStretch .default:n = {1.2}
2560
2561 }
2562 (*xetexx)
2563 \keys_define:nn {fontspec}
2564 {
2565
      FakeBold.code:n =
2566
        \@@_update_featstr:n {embolden=#1}
2567
       },
2568
     FakeBold .default:n = {1.5}
2569
2570 }
<sub>2571</sub> (/xetexx)
<sub>2572</sub> (*luatex)
2573 \keys_define:nn {fontspec}
2574 {
     FakeBold .code:n = { \@@_warning:n {fakebold-only-xetex} }
2575
2576 }
<sub>2577</sub> (/luatex)
```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create 'fake' shapes.

The behaviour is currently that only if both AutoFakeSlant and AutoFakeBold are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I'd like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```
2578 \keys_define:nn {fontspec}
2579 {
2580 AutoFakeSlant .code:n =
2581 {
```

```

38.8.3 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

40 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever \setmainfont and friends was run.

\fontspec_setup_maths:

Everything here is performed \AtBeginDocument in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
3662 \@ifpackageloaded{euler}
3663
     \bool_set_true:N \g_@@_pkg_euler_loaded_bool
3664
3665
3666
      \bool_set_false:N \g_@@_pkg_euler_loaded_bool
3667
3668
3669 \cs_set:Nn \fontspec_setup_maths:
3671
      \@ifpackageloaded{euler}
3672
        \bool_if:NTF \g_@@_pkg_euler_loaded_bool
3673
         { \bool_set_true: N \g_@@_math_euler_bool }
3674
         { \@@_error:n {euler-too-late} }
3675
3676
      {}
3677
      \@ifpackageloaded{lucbmath}{\bool_set_true:N \g_@@_math_lucida_bool}{}
3678
      \@ifpackageloaded{lucidabr}{\bool_set_true:N \g_@@_math_lucida_bool}{}
3679
      \@ifpackageloaded{lucimatx}{\bool_set_true:N \g_@@_math_lucida_bool}{}
3680
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, cmr, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in Lagrange maths font to still go back to the legacy cmr font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a \hat accent in EulerFractur, but it's ugly. So I ignore it. Sorry if this causes inconvenience.)

```
3681
      \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
      \label{legacymaths} $$ \operatorname{SymbolFont}(\operatorname{legacymaths}_{0T1}_{cmr}_{bx}_n) $$
3682
3683
      \DeclareMathAccent{\acute}
                                      {\mathalpha}{legacymaths}{19}
      \DeclareMathAccent{\grave}
                                      {\mathalpha}{legacymaths}{18}
3684
      \DeclareMathAccent{\ddot}
                                      {\mathalpha}{legacymaths}{127}
      \DeclareMathAccent{\tilde}
                                      {\mathalpha}{legacymaths}{126}
3686
                                      {\mathalpha}{legacymaths}{22}
3687
      \DeclareMathAccent{\bar}
3688
      \DeclareMathAccent{\breve}
                                      {\mathalpha}{legacymaths}{21}
      \DeclareMathAccent{\check}
                                      {\mathalpha}{legacymaths}{20}
3689
                                      {\mathalpha}{legacymaths}{94} % too bad, euler
      \DeclareMathAccent{\hat}
3690
                                      {\mathalpha}{legacymaths}{95}
3691
      \DeclareMathAccent{\dot}
      \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}
3692
```

\colon: what's going on? Okay, so: and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```
% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{"3A}
% \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
%
```

```
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
% \mkern-\thinmuskip{:}\mskip6muplus1mu\relax}
%
% % euler.sty:
% \DeclareMathSymbol{:}\mathrel {EulerFraktur}{"3A}
%
% % lucbmath.sty:
% \DeclareMathSymbol{\@tempb}{\mathpunct}{operators}{58}
% \ifx\colon\@tempb
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}
```

 $(3A_16 = 58_10)$ So I think, based on this summary, that it is fair to tell fontspec to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```
3693 \group_begin:
3694 \mathchardef\@tempa="603A \relax
3695 \ifx\colon\@tempa
3696 \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
3697 \fi
3698 \group_end:
```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```
3699 \bool_if:NF \g_@@_math_euler_bool
3700 {
3701 \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}\
3702 \DeclareMathSymbol{:}{\mathrel} {legacymaths}{58}\
3703 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}\
3704 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}
```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

3736
     }
3737
```

Finally, we change the font definitions for \mbox{mathrm} and so on. These are defined using the $\glue{g_@mathrm_tl}$ (...) macros, which default to $\mbox{rmdefault}$ but may be specified with the $\mbox{setmathrm}$ (...) commands in the preamble.

Since LaTeX only generally defines one level of boldness, we omit \mathbf in the bold maths series. It can be specified as per usual with \setboldmathrm, which stores the appropriate family name in \g_@@_bfmathrm_tl.

```
\DeclareSymbolFont{operators}\g_fontspec_encoding_tl\g_@@_mathrm_tl\mddefault\updefault

3756
3757 }
```

\fontspec_maybe_setup_maths:

We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'MTEXFont Catalogue': http://www.tug.dk/FontCatalogue/mathfonts.html. I'm sure there are more I've missed. Do the TEX Gyre fonts have maths support yet?

Untested: would \unless\ifnum\Gamma=28672\relax\bool_set_false: N \g_00_math_bool\fi be a better test? This needs more cooperation with euler and lucida, I think.

41 Closing code

41.1 Compatibility

```
_{3802} \tl_set:Nn \zf@basefont { \l_fontspec_font } _{3803} }
```

41.2 Finishing up

Now we just want to set up loading the .cfg file, if it exists.

```
3804\bool_if:NT \g_@@_cfg_bool
3805 {
3806 \InputIfFileExists{fontspec.cfg}
3807 {}
3808 {\typeout{No~ fontspec.cfg~ file~ found;~ no~ configuration~ loaded.}}
3809 }
```

42 Changes to the NFSS

3810 (*fontspec)

42.1 Italic small caps and so on

\textsi These commands for actually selecting italic small caps have been defined for many years; I'm inclined to drop them. They're probably used very infrequently; I personally prefer just writing \textit{\textsc{...}} instead.

```
3811 \providecommand*\itscdefault{\itdefault\scdefault}
3812 \providecommand*\slscdefault{\sldefault\scdefault}
3813 \DeclareRobustCommand{\sishape}
3814 {
3815 \not@math@alphabet\sishape\relax
3816 \fontshape{\itscdefault}\selectfont
3817 }
3818 \DeclareTextFontCommand{\textsi}{\sishape}
```

LATEX'S 'shape' font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:

```
3819 \cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }
3820 \tl_const:cn { \@@_shape_merge:nn \itdefault \scdefault } {\\itscdefault}
3821 \tl_const:cn { \@@_shape_merge:nn \scdefault \scdefault } {\\itscdefault}
3822 \tl_const:cn { \@@_shape_merge:nn \scdefault \itdefault } {\\itscdefault}

```

\fontspec_merge_shape:n These macros enable the overload on the \..shape commands. First, a shape 'new+current' (prefix) or 'current+new' (suffix) is tried. If not found, fall back on the 'new' shape.

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```
3834 \prg new conditional: Nnn \@@ if merge shape:n {TF}
                             3835
                             3836
                                                       \bool_if:nTF
                                                              {
                             3837
                                                                     \tl_if_exist_p:c { \@@_shape_merge:nn {\f@shape} {#1} }

4063
4064
4065 }
```

43.3 \oldstylenums

\oldstylenums This command obviously needs a redefinition. And we may as well provide the reverse \liningnums command.

```
4066 \RenewDocumentCommand \oldstylenums {m}
4067 {
4068     { \addfontfeature{Numbers=OldStyle} #1 }
4069 }
4070 \NewDocumentCommand \liningnums {m}
4071 {
4072      { \addfontfeature{Numbers=Lining} #1 }
4073 }
4074 \( \frac{\fontspec} \)
```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
